

Einführung in die phänomenologische Forschung

Commentary on Heidegger, *Einführung in die phänomenologische Forschung* (GA 17, Winter Semester 1923–24)

This is a unit-by-unit commentary on the main text of GA 17, Heidegger's Marburg lecture course of Winter Semester 1923–24, covering pages 1–292 of the Gesamtausgabe volume (the Vorbemerkung through the end of the Third Part; the Anhang of *Ergänzungen* is not included). Citations are given by GA 17 page number in parentheses and by the editor's section numbers (§). German technical terms are retained, with an English rendering on first use. Greek terms from the Aristotle interpretation are kept in Greek and glossed. The text was dictated and editorially structured by F.-W. von Herrmann; the chapter and section headings are the editor's formulations of divisions immanent in Heidegger's continuously written manuscript, and they are reproduced here in English translation.

A few characteristic traps govern the reading throughout. First, φαίνόμενον must not be heard as *Erscheinung*, the "appearance" of some hidden thing standing behind it; for Heidegger φαίνόμενον means what shows itself *from itself*, and the slide into "appearance-of-something" is precisely the degeneration he is tracking. Second, Aristotle's *De anima* is not a psychology and αἴσθησις is not an *Erlebnis*: perceiving, thinking, and willing are not inner mental experiences but ways of a living being's being-in-its-world. Third, the lecture's organizing diagnostic phrase *Sorge um erkannte Erkenntnis* ("care for known knowledge," the concern to possess secured cognition) is a deficient, historically concrete mode and must not be silently identified with the existential *Sorge* of *Sein und Zeit*, even though it plainly anticipates it. Fourth, the realist/idealist opposition does not exist in Greek thought, so Aristotle's talk of a "condition" of visibility must not be read as Kantian transcendental idealism. Fifth, *Bewußtsein* (consciousness) is itself a post-Cartesian construct, not a natural or neutral starting point; the Greeks had no concept of it. Sixth, Heidegger's critique of Husserl is immanent — a radicalization of "to the things themselves," not an external rejection. Seventh, *Destruktion* is not demolition but the positive uncovering of the origin-history of inherited categories. And throughout, the core historical thesis is that Descartes converts *verum* into *certum* — that truth gets reinterpreted as certainty — so *certum* and *verum*, like *Evidenz* and a mere feeling of self-givenness, must be kept apart.

Vorbemerkung: The task of the lecture and the passion of genuine and right questioning

Heidegger opens by giving the course a double task. First, to fix and open up the horizon within which determinate *Tatbestände* — states of affairs, matters of fact in the phenomenological sense — are to be expected; this is a preliminary orientation of the direction of looking and a stripping-away of mistaken expectations. Second, to take up concretely the matters thus brought near, gaining familiarity with the objects and with the manner of theoretical dealing with them. The pairing is already methodologically loaded: one cannot encounter the matters without first clearing the field of vision, and clearing the field means removing what we falsely anticipate. The talk of *Blickrichtung*, direction of the gaze, signals that phenomenology here is a discipline of how one looks before it is a doctrine of what one sees.

Two false expectations are to be stripped away. The course will not give journalistic information about phenomenology, betraying some trick of essential intuition (*Wesensschau*) — a swipe at the popular image of Husserlian method as a knack to be acquired. The second false expectation is more deeply entrenched and so more dangerous: no foundation, program, or system will be offered, and not even philosophy is to be expected. Heidegger states his conviction that philosophy is at an end, that we stand before wholly new tasks having nothing to do with traditional philosophy. He immediately demotes this very pronouncement to a mere *Leitfaden*, a guiding thread: what alone matters are the *Tatbestände*; demarcation, classification, interpretation, and polemical confrontation are secondary. The rhetorical structure is deliberate — the radical thesis about the end of philosophy is announced and then subordinated, so that the listener does not convert it into a new doctrine to be held. This is the first enactment of the lecture's central worry, that we philosophize in words rather than in the matters.

The task of the following considerations is then specified as threefold: clarification of the expression "phenomenology"; making present the breakthrough of phenomenological research in Husserl's *Logische Untersuchungen*; and making present the subsequent development of phenomenology from there — how far it is held fast, how far it is bent aside or in the end surrenders its decisive meaning. This tripartite plan maps onto the lecture's actual arc: the Aristotle interpretation and Husserl's self-interpretation (Part One), the regress to Descartes and scholastic ontology that exposes the origin of the deformation (Part Two), and the demonstration that the question of being has been missed, together with the pointing-out of *Dasein* (Part Three). The verb *vergegenwärtigen*, to make present, marks the work as one of retrieval rather than report.

Heidegger then names the lexical route. *φαινόμενον* and *λόγος* are two originary words of Greek philosophy; from the history of their shift in meaning the emergence of the specific sense of "phenomenology" becomes intelligible. Insofar as these words "speak *Dasein*," their clarification moves within the *Daseinsgeschichte* of Western humanity and the history of its self-interpretation. Two things are doing work here. The words are not chosen arbitrarily as etymological curiosities; they are taken to articulate a way of being, so that tracing their semantic history is at once tracing the history of how Western existence has understood itself. And the appearance of *Dasein* this early, said of the Greeks, shows that the term is already Heidegger's name for the human way of being-in-a-world, even as the technical apparatus is still forming — and even as the same word will recur in this very lecture in a more ordinary register (the "presence in the day" of the next chapter).

From Husserl's self-interpretation of phenomenology just after the *Logische Untersuchungen*, Heidegger continues, it becomes intelligible how Husserl grasps and develops further the phenomenological research-task. He fixes the main theme in advance: *Dasein* — that is, world, dealings within it, temporality, language, the self-interpretation of *Dasein*, and the possibilities of interpreting *Dasein*. This forward-pointing inventory is essentially the table of contents of *Sein und Zeit* three years before its publication; *Zeitlichkeit* (temporality) and *In-der-Welt-sein* are already named as the headings under which the matter will be developed. The point of method is that the critical engagement with Husserl is meant to issue in this positive theme, not merely to refute.

Finally, the three presuppositions. No presupposition of philosophical knowledge is required; against that, three are demanded, all gathered under the passion of genuine and right questioning. The passion does not fall to one arbitrarily — it has its time and its tempo — but a readiness must be there, consisting in three things, which Heidegger then glosses one by one. The first is *Bekümmern*, a troubled concern, about an instinctively secure superiority over prejudice. The second is the care to become at home in a particular science. The third is composure in the face of the fact that life helps the questioning knower to everything other than a settled psychic comfort — the so-called theoretical attitude of mere contemplation. Already here the *theoretische Betrachtung* is named as a kind of complacency to be resisted, foreshadowing the whole critique of the theoretical to come.

The three glosses sharpen each point. *Ad 1*: the demand is not freedom from prejudice, which is a utopia — the opinion that one has no prejudice is itself the greatest prejudice. What is asked is a superiority toward every possibility that something may turn out to be a prejudice: not being free *of* prejudices but being free *for* the possibility of giving one up, in the decisive moment, out of the confrontation with the matter itself. This is named

the *Existenzform* of the scientific human being. The reformulation is characteristic: the ideal of presuppositionlessness is replaced by a readiness to be unsettled by the thing, and "science" is located not in a body of results but in a form of existence. *Ad 2*: science taken as a worked-up collection of material produces a weariness of knowledge, and this is characteristic of present-day educational consciousness; one must see that just this aspect is the calamity, that one no longer understands what is actually going on. This cowardice before questioning, Heidegger adds, often dresses itself up as religiosity, to which ultimate self-confronting questioning appears as presumption — so one flees a fundamental possibility of *Dasein*. The sciences are a possibility of *Dasein* and of its confrontation with itself; when each person, in his place before his science, has experienced in determinate questions that he is here confronting himself and the world, then it is understood what science means. *Ad 3*: the readiness to question consists in a certain maturity of existence — not lapsing into surrogates, not aiming to be finished as quickly as possible, but enduring for years in uncertainty, ripening out of it for the confrontation with the matters, being free to deny oneself every premature answer. This requires freeing oneself from a tradition that was genuine in Greek philosophy: scientific comportment as θεωρία, theory. The closing line turns reflexively on the lecture itself — the listeners are not to think that they must mean what is meant here. The course demands the very freedom-for-being-unsettled that it has just described, refusing to install itself as a new doctrine.

ERSTER TEIL: φαινόμενον and λόγος in Aristotle, and Husserl's self-interpretation of phenomenology

Chapter One: Clarification of the expression "phenomenology" by regress to Aristotle

Before §1 the chapter opens with a historical survey of the word. The expression "phenomenology" first appears in the eighteenth century in the school of Christian Wolff, in Lambert's *Neues Organon* (1764), alongside analogous formations then in vogue — *Dianoilogie*, *Alethilogie* — and means there theory of *Schein*, the doctrine of the avoidance of semblance. A kindred concept is in Kant, who in a letter to Lambert speaks of a merely negative science, a *phaenomenologia generalis*, that must precede metaphysics and determine the validity and limits of the principles of sensibility. Later "Phänomenologie" becomes the title of Hegel's chief work; in nineteenth-century Protestant theology there is a phenomenology of the religions as a doctrine of the various ways religions appear; and the word occurs in Brentano's lectures on metaphysics. Heidegger then poses the guiding questions: why did Husserl choose this expression; why in the eighteenth century is the doctrine of the avoidance of semblance

called phenomenology; and how does φαινόμενον come to mean *Schein*, semblance? Do motives lie in the word φαινόμενον itself for using it to designate semblance? The historical survey is not antiquarian: it sets up the puzzle that the word for "what shows itself" should have come to name the doctrine of deceptive seeming, and the whole Aristotle interpretation is the attempt to recover the original sense from which that drift becomes intelligible.

One methodological exclusion is laid down at once. The term *Erscheinung*, appearance, must be set aside, since as a supposed rendering of the Greek words it only breeds confusion. Even *Περὶ ψυχῆς*, "On the Soul," is misleading if one attends to what is actually being discussed there: for Aristotle, perceiving, thinking, and willing are not *Erlebnisse* at all. *De anima* is not a psychology in the modern sense but treats of the being of the human being — and of the living in general — in the world. This is the second misreading-guard stated by Heidegger himself: the entire analysis to follow must be kept clear of the modern frame in which soul-matters are inner experiences and the title "On the Soul" names a science of mental states.

§ 1. Clarification of φαινόμενον from Aristotle's analysis of the perception of the world in the mode of seeing

a) φαινόμενον as a distinctive way in which beings are present: being-present in daylight

Heidegger starts from the make-up of the word. "Phenomenology" is built from λόγος and φαινόμενον; φαινόμενον means *what shows itself*. φαίνομαι is "to show oneself," φαίνω "to bring to light," and the root φα is cognate with φῶς, light. His method follows from this: take a concrete piece of scientific writing and work out which matters its words are actually meant to pick out. The order is deliberate — first bring the thing itself to mind on its own, apart from the word for it; then return to the text and ask in what sense the word was meant to name it. The text he chooses is *De anima* II.7, on perceiving the world by sight. Everything drawn from physics and physiology is to be set aside, since it pulls the gaze away from what Aristotle is actually looking at. Heidegger adds that so concrete an analysis was never attempted again — a remark that doubles as a charge against the later tradition for losing contact with the things themselves.

The analysis proper opens with a question: what is seeing, what is the seen as such, and how is what seeing gives access to be described — in its content and in its visibility? Aristotle's answer: what sight perceives is the visible (ὄρατόν), and the visible shows up as color; color is what is spread over a thing that is visible in its own right; and a thing's color is perceived only ἐν φωτί, in light. The point is that the question is not what color *is* as a physical property but how the visible *is given* — and the answer turns at once on light as the medium through which it is given.

So we have first to make out what light is. Light is evidently what lets us see *through* it — the διαφανές, the transparent. It is not itself visible; we see it only by way of some other thing's color. Light is what makes things visible: specifically, it is in light that I see a thing's own color (οἰκεῖον χρῶμα). The decisive move is that light is not itself one of the things seen but the condition under which colored things can be seen — and yet it is not a subjective form imposed by the mind; it belongs to the world. Heidegger stresses Aristotle's discovery that light is no body at all: not fire, not any body, not an emanation from a body, but the *presence* (παρουσία) of fire or the like in the transparent. It does not move; it is the way the sky itself is there, the making-visible of things, the *being of day*. Light, in short, is a mode of presence (παρουσία, ἐντελέχεια). Empedocles, who held that light travels, is wrong; and Trendelenburg, who read Aristotle's account as a step backward, missed the point. Heidegger here uses *Dasein* in its ordinary sense — the sky's *being-there*, daylight's *being-present* — alongside the technical sense fixed in the Vorbemerkung. The word names *presence*: brightness is a *way the world is*, not a stimulus striking a subject.

αἴσθησις, perceiving, is then said to be a way a living thing *is there* (Dasein) in its world. Aristotle sorts the kinds of perceiving by the kind of thing perceived — by what each gives access to. The perceptibles (αἰσθητά) fall into three kinds: ἴδια, κοινά, συμβεβηκότα. The reorientation is decisive: perception is classified not by sense-organ or mental faculty but by the *mode of being* of what it gives access to, so that the analysis of sight is already an analysis of a way of being-in-the-world.

Heidegger takes the three in turn. An ἴδιον is what is accessible through *one* sense and that sense alone, and it has the character of being *always true* (ἀεὶ ἀληθές): sight, just by being sight, only ever discloses color, hearing only sound. A κοινόν is a feature not tied to any single sense — movement (κίνησις), for example. A συμβεβηκός is what we perceive *as a rule* — Aristotle's example is seeing the white thing as the son of Diares — for ordinarily I do not see bare color or hear bare tones but the singer's song, what comes along with whatever is perceived first and most directly; and it is with the συμβεβηκός that deception becomes possible, and indeed normal. The ordering matters for the whole lecture. The "proper" object of a single sense (the ἴδιον) is always true, but we reach it only by an artificial isolation; what we ordinarily and concernfully perceive — houses, people, the song — is the incidental (κατὰ συμβεβηκός), and that is exactly where error lives. Truth and falsity are thereby shifted away from the bare sense-datum and onto the thing we actually encounter in the world.

Returning to light as what conditions an ἴδιον, Heidegger restates the result: light is the presence of fire; it does not move; what moves is the sun, whose presence the light is; and anyone who says the light itself moves is speaking *past the phenomena* (παρὰ τὰ φαινόμενα), past what shows itself. φαινόμενον is what shows itself, of itself, and is in

that very showing immediately *there*. He then sets up the comparison with Kant with care. One could say, in Kant's idiom, that light is the *condition of the possibility* of perceiving color; but it is precisely at this borrowed phrase that the two senses of "condition" must be told apart. The point is not to cast Aristotle and Kant as realist and idealist — that opposition does not exist for the Greeks. What does "condition of the possibility of perceiving color" mean for Aristotle? Color is seen in the light; the thing seen must be in the daylight; and the light belongs to the *being of the world itself*. Being a condition, here, concerns *a way the world is*. To being-there in a world belongs the presence of the sun — just what we mean when we say: it is day. What we are pointing to is something about the being of the world, not about a mind. Hence the first result: φαίνόμενον means, to begin with, nothing other than *a distinctive way in which beings are present*. This applies the central guard directly: Aristotle's "condition" is *ontological* — a way the world is — not the transcendental, mind-side condition of a representing subject; to read it as Kantian idealism would falsify it.

b) φαίνόμενον as whatever shows itself of itself, in light or in darkness

Heidegger now broadens the term. φαίνόμενον is not confined to things present in daylight; it covers *whatever shows itself of itself*, whether in light or in darkness. The widening matters: it detaches "showing itself" from the privileged case of daylight visibility and prepares the claim that the core sense is *self-showing*, not being lit up by a medium.

What, then, is darkness? On a glib account it is easy: light is the διαφάνεζ, what makes seeing possible, and darkness the ἀδιαφάνεζ, what does not. But darkness too lets something be seen. Some things are visible *only* in the dark: not everything is visible in light — only each thing's own color is — while some things go unseen in light yet produce perception in the dark, such as phosphorescent, glowing things (πυρώδη φαίνόμενα). Darkness, then, is a quite specific way of letting things be seen. To mark off the dark from the light, Heidegger reaches for a basic Aristotelian distinction: between being *in actuality* (ἐντελεχείᾳ) and being *in potentiality* (δυνάμει ὄν). Darkness is a being-in-potentiality — something wholly *positive*, not a mere lack. We cannot really grasp this structure, he concedes, because our own stock of categories has never developed concepts this basic. Insofar as darkness is an *absence*, it has to be called a στέρησις, a privation — the lack of something that ought to be present; and the being of darkness consists in *being possible light*. So it would miss Aristotle to say simply that light lets us see and darkness does not: darkness lets us see too. The discussion of darkness is doing real work. It shows that the operative framework is *actuality/potentiality* and *presence/privation*, not a flat opposition of light to its mere absence — and it lets Heidegger note how impoverished the modern stock of categories is beside the Greek.

A methodological warning follows. Philosophy's basic concepts, as they come down to us through history, are not a stock of assets the discipline can simply hold on to apart from that history; they have become a genuine *fate* hanging over us (*Verhängnis*), because our whole way of seeing and interpreting human existence is shot through with concepts we possess as mere words. The great danger is that today one philosophizes in *words* instead of in the *things*. This is the Vorbemerkung's worry, now sharpened, and the seed of the later doctrine of *Destruktion*: inherited concepts are not neutral tools but a fate that has covered the things over, and the only cure is to win them back from their source.

Heidegger now brings the two words together. φαινόμενον and λόγος both give voice to something real. Later it will become clear — from motives lying in human existence itself — how φαινόμενον can come to mean *semblance* (*Schein*), and further how a philosophy gone superficial, running along the surface of its words, comes to take what is there as the "appearance of something" behind it. Aristotle had no such crude metaphysics; and when people today use the word "appearance" to mount a critique of phenomenology, that is a baseless move Heidegger can only protest — with a glance at Rickert's 1923 *Logos* essay. Two guiding theses are planted here: that the slide of φαινόμενον into *Schein* and into "appearance-of-something" has its source in human existence itself and will be accounted for later, and that the current anti-phenomenological use of "appearance" is without ground. It is the guard against reading φαινόμενον as *Erscheinung*, now turned polemically outward.

φαινόμενον, then, is what shows itself, of itself, as *being there*; it is met with in living, insofar as a living thing stands toward its world so as to see it, to perceive it at all in αἴσθησις. The proper sensibles (ἴδια αἰσθητά) are what is perceived in the strict sense; the incidental (κατὰ συμβεβηκός), by contrast, is perceived in such a way that something is already there in advance. It is only thus that we see *houses, trees, people*. To get back to the bare ἴδια takes a deliberate, artificial stance. The word φαίνεσθαι already refers to what is perceived κατὰ συμβεβηκός: when the sun shows itself, it is there *a foot wide* — it does not merely *look* a foot wide. This applies the guard exactly: the sun's being-there-a-foot-wide is a way it *shows itself*, not a mere appearance set against its real size; φαίνεσθαι means self-showing, not seeming. And the priority of the incidental over the proper sensible is reaffirmed: our everyday seeing of houses and people comes first; isolating pure color is a later, artificial achievement.

The depth of Aristotle's seeing shows, Heidegger continues, in his not being thrown by the fact that the things only the night reveals have no collective name — none, for instance, for glow-worms and the like. The visible is color, but also that which "can be said in speech yet happens to be nameless." For Aristotle the only thing that matters is that these things are there, are seen, and by their content have a claim to count as

beings. But the very lack of a name for them shows that our language — and with it our stock of categories — is a *language of the day*. This is true of Greek above all, and is bound up with the basic cast of Greek thinking and concept-formation. The fix is not to build a complementary "category-doctrine of the night"; we have to get back *behind* the opposition altogether, so as to understand why the day enjoys this privilege in the first place. The remark is more than philological: the namelessness of what only the dark reveals exposes that the inherited conceptuality is governed throughout by *presence-in-the-light* — something Heidegger marks for interrogation rather than repair, an early sign of his thesis that the metaphysics of presence rests on a privileging of the day.

Finally, the term's sharpening within science. The phrase παρὰ τὰ φαινόμενα, frequent in Aristotle, brings out the special *claim* that the φαινόμενον — and what is grasped through it — makes on us. When the explicit task is to grasp what is there, to hold on to it, to win what shows itself as it is in itself, we are operating within science. Here φαινόμενον takes on its sharpest sense: what shows itself of itself, now with the express claim to serve as the *ground* for all further questioning and explication. For science it is a matter of σώζειν τὰ φαινόμενα, *saving the phenomena* — and in being saved, what shows itself of itself is pushed into a foundational role. This is something only science does, since science aims to grasp and exhibit beings *undisguised*. The being of the scientist is a definite way of being *positioned toward* the world; and this comportment (ἔξις) has two belonging-together sides: familiarity with the things the science is about (ἐπιστήμη) — and here the sentence breaks off at the page boundary, to be continued in the next stretch of text. What this paragraph secures is the highest sense of φαινόμενον for Heidegger's purposes: not merely what shows itself, but what shows itself as *the very ground on which inquiry stands*, with "saving the phenomena" as science's basic obligation. This is the sense to which "phenomeno-logy" will be held, and whose loss the whole lecture is written against. The link back to the Vorbemerkung is explicit — there too the scientist's science was a *form of existence* (Existenzform), not a body of results: science is once again a *comportment*, a ἔξις, a way of being positioned toward the world, not a stock of propositions.

With this, the interrupted sentence finishes across the page break. The two belonging-together sides of the scientist's comportment (ἔξις) are: first, familiarity with the subject matter of the science (ἐπιστήμη τοῦ πράγματος); and second, a certain *upbringing* or *formation* (παιδεία) — a being so trained that one knows how to conduct oneself in a field of inquiry. Someone with παιδεία can tell reliably whether an investigator is drawing what he says *from the matter itself* (καλῶς ἀποδίδωσιν) or merely chattering; and it is out of such formation that one decides which kind of investigation suits a given object. One such decision: whether, like the earlier thinkers, to treat a thing's being and its determinations as secondary and to talk first about how it

came to be (γένεσις) — or not. Aristotle's answer is straightforward: only once the ground for inquiry has been secured can one take up the question of origin and of *why* something originates. In building a house, what must be settled first is the εἶδος and only then the ὕλη, the material: εἶδος means the look a thing presents, its showing-itself — the house's standing there, in its setting, as a house, its "face." And the section ends with the formula that gathers the whole regress: *the phenomenon is the being itself* (Das φαινόμενον ist das Seiende selbst). This closing does two things. It ties the methodological priority of εἶδος over ὕλη — of *what* and *that* a thing is over how it came to be — to the priority of φαινόμενον as ground: one must first secure what shows itself before asking after its origin, a priority Heidegger will turn throughout the lecture against the modern, genetic, causal-explanatory habit of mind. And the closing identification — phenomenon = the being itself — once more shuts off the *Erscheinung*-reading: the phenomenon is not a representation or appearance *of* the being but the being *in its showing itself*.

§ 2. The Aristotelian determination of λόγος

a) Speech (λόγος) as voice that means something (φωνή σημαντική); ὄνομα and ῥῆμα

Heidegger asks in what connection the concept of φαινόμενον stands with what Aristotle explicates as λόγος. τὸ φαινόμενον is the being that, in a possible inquiry, must be so appropriated that it yields the ground for the posing of questions. He then draws a sharp consequence: the expression φαινόμενον is accordingly not a category of apprehension, *Auffassungskategorie*, but a way of being, a *how* (Wie) of encountering — and indeed of the first and as such first-legitimate encountering. This is a load-bearing claim and another statement of the central guard: φαινόμενον names not how a subject takes things up but how beings are, in their way of being-encountered, prior to and more original than any theoretical apprehension.

He sets the Greek frame against the modern one. The category "object," *Gegenstand*, was foreign to the Greeks. In its place stood πρᾶγμα, that with which one has to do in dealings, what is present for the concerned dealing-with-things, *Besorgen*. "Object," by contrast, means what stands over against the mere observer in the form of bare looking-at, what is thematically singled out and, as such, held present. φαινόμενον means the being-there itself, is a determination of being, and must be understood in a way that brings out its character of showing-itself. τὰ φαινόμενα can be represented by τὰ ὄντα and is what is always already there, what meets us the moment we open our eyes; it does not first need to be disclosed but is often covered over, and the whole stress falls on the character of the *Da*, the 'there'. Two of the lecture's deepest contrasts are compressed here: πρᾶγμα (the handled, the thing of concerned dealings) against *Gegenstand* (the merely beheld object of theoretical staring), and the thesis that the phenomenal is *already there* and *often covered over* — so that the work of

phenomenology is not construction but un-covering. This πράγμα/*Gegenstand* opposition is the kernel of the later critique: the modern object of theoretical cognition is a derivative, leveled-off mode of the πράγμα of concerned dealings.

Turning to *De interpretatione*, Heidegger notes its character: it is not a finished work but a manuscript of Aristotle's latest period, grown from a momentary reflection that made no pedagogical provision; its consideration is purely distinguishing and in no way presentational. λόγος is vocal being that means; it is voice — λόγος δέ ἐστι φωνή σημαντική. Three questions are then staged in order: what is φωνή, then what is φωνή σημαντική, and finally what is λόγος? The staging structures the whole of §2a: voice, meaningful voice, and articulated speech.

φωνή (drawing on *De anima* II, chapter 8) is a tone-like thing produced by an ensouled being, a noise made by a living thing: ἡ δὲ φωνή ψόφος τίς ἐστιν ἐμψύχου. Something is sounding when something strikes upon something in something; but voice is in and with the being of a living thing, φωνή δ' ἐστὶ ζώου ψόφος. For this being of voice it is necessary that there be something like πνεῦμα, breath. Just as the tongue has within the being of the living thing two functions — tasting, and making speech possible, the second not occurring in every living thing as such — so too πνεῦμα has the task of giving off inner warmth for the body and, second, of serving speech. To have a voice is a distinctive way of being alive. The reconstruction is careful to keep the analysis ontological rather than physiological: breath and tongue are taken up not as organs in a causal story but as belonging to the way a living being *is* such that it can speak.

Not every noise issuing from a living thing is already voice — οὐ γὰρ πᾶς ζώου ψόφος φωνή — one can also produce mere sounds with the tongue, such as coughing. The difference is that in the sound, right in the middle of it, φαντασία is contained: ἀλλὰ δεῖ ἐμψυχόν τε εἶναι τὸ τύπτον καὶ μετὰ φαντασίας τινός — then it is voice. Heidegger recovers the objective sense of φαντασία: in ordinary language it means splendor, show, looking-like-something — a wholly objective meaning, φαντασία as *that something shows itself*. The sound is voice (speech-sound) when with it something is to be perceived, to be seen; and on the ground of φαντασία one designates the noise as σημαντική, meaningful. The point is precise and important: φαντασία is read not as a subjective faculty of imagination but as the self-showing of something, so that meaningful voice is voice through which something shows itself — keeping the whole account on the side of the φαινόμενον rather than of inner representation.

λόγος has parts that are still meaning-bearing, but only ὡς φάσις, as mere saying: the meaning of the parts is bare saying. "The stove gives warmth" is decomposable into "stove" and "gives warmth"; "stove" still means something, is intelligible, intends something, and "gives warmth" is already something for itself. But the composition does

not yet give the λόγος "the stove gives warmth" as a κατάφασις: it is merely intelligible in the manner of φάσις, not spoken in the sense of λόγος, which is the συμπλοκή, the interweaving, of ὄνομα and ῥῆμα. The distinction between φάσις (mere meaningful saying of a part) and κατάφασις (the asserting interweaving that lets a being show itself) is the hinge on which §2b will turn, and it is set up here.

The name too is a vocal thing intelligible as such. Heidegger takes up Aristotle's definition: ὄνομα is φωνή σημαντική κατὰ συνθήκην ἄνευ χρόνου, a meaningful voice by convention, without time, no separated part of which means anything on its own — in "Κάλλιππος" the "ἵππος" means nothing by itself, unlike in the phrase "καλὸς ἵππος." The meaning of a word is not already there on the ground of the possibility of speaking through throat and tongue; these are φύσει, by nature, but a word is not. Words are κατὰ συνθήκην, by stipulation: each word as such has first come to be and has its γένεσις. The word-sound does not have once and for all and properly the fixed meaning that means the matter — the word as a whole is not drawn from primary, originary experience of the matter but from prior opinions and nearest views of things. The genesis of the word is borne not by the physiological being of the human but by his proper existence: insofar as the human is in the world, wills something in it and with himself, he speaks. He speaks insofar as something like world is disclosed for him as something to be taken care of, and in the "for him" he himself is disclosed. This is a dense and forward-pointing claim: language is grounded not in physiology but in existence, in being-in-a-world that is concernfully disclosed — and the conventionality of words means they carry sedimented "prior opinions," a thesis that underwrites the whole program of winning concepts back from the matters rather than inheriting them as word-possession.

The word is not there as a tool, οὐχ ὡς ὄργανον, like the hand; language is the being and becoming of the human being himself. What is named in a name is so named that it is lifted out of every time-determination, ἄνευ χρόνου: it is simply a particular named *what*, and this holds even for names that refer to temporal things — "year" does not mean this year or the next. No detachable part of a name means anything for itself; if I lay the parts together I never arrive at the unitary meaning. The togetherness of these syllables is established only by the unitary meaning, and only in light of that meaning is the spoken articulation intelligible. Heidegger glosses Aristotle's point that a word is a word only when a vocal thing becomes σύμβολον — recovering the original Greek sense of σύμβολον as the broken rings that spouses or friends give each other at parting, so that on reunion the one part is recognized by being fitted to the other. The one refers to the other; σύμβολον makes another recognizable; the meaning-bearing word refers to its matter. There are sounds that give something to be known without meaning anything, ἀγράμματοι, such as groaning; these lack the stamp that would let one write or read them, which goes only on the ground of meaning. The reading holds

language together as a referential whole founded in unitary meaning: against any building-up of sense from atomic parts, meaning is prior to articulation, and the word is a referring-to-the-matter, not a tool laid alongside things.

Heidegger then steps back to the situation of any interpretation of λόγος. λόγος is already used in ordinary language for a fundamental characteristic; in every interpretation of λόγος we already have a determinate prior opinion about its sense. We know in a wholly indeterminate way what speaking, language is, but we have no secure information about what language meant for the Greeks in their natural *Dasein*, how they saw language. Hellenism does have linguistics and grammar — doctrinal treatment and theory — and from here all modern grasp of language is influenced, together with the influences of epistemology and so forth, so that the question how the Greek lived in his language is no longer even posed. For now we must simply put up with this basic unclarity about the *Dasein* of language; but a determinate concept of language lies, and must lie, at the ground for us. We hold it in suspense, shaping our view of language concretely only so far as there is warrant for it. One thing can be said with security: the Greek lived in language in a special way and was lived by it — and he was aware of this. The being-able-to-address-and-discuss what is encountered, world and self — which need not be philosophy — he characterizes as being-human: λόγον ἔχειν, to have language. This passage is methodologically central. It applies the hermeneutic-situation point reflexively to the very investigation under way — we always bring a prior concept of language — and it states the thesis, drawn from Politics A 2, that the classical definition of the human as ζῶον λόγον ἔχον is to be heard not as "rational animal" but as the living thing that is in the world by addressing and discussing what it encounters.

A determination from *De interpretatione* (end of chapter 3) is brought in: spoken by themselves, the ῥήματα are ὀνόματα and mean something, for the one who speaks brings the thinking to a stand, ἵστησι γὰρ ὁ λέγων τὴν διάνοιαν, and the one who hears comes to rest, ὁ ἀκούσας ἡρέμησεν. When we simply live along, the world is there; we deal with it, are occupied with it. When a word is spoken, the meaning is set before something; in understanding the word I dwell with it, having come to rest in what is meant. The hearer rests in the understanding of the word; in understanding the word I rest with what it means. To understand something means: to have something there, to have it in the manner of understanding a naming of the named. Heidegger stresses, especially against Plato, that for Aristotle speaking, when it moves in language, is something that according to its proper being grows out of the free discretion of the human and is not φύσει. The "bringing-to-a-stand" and "coming-to-rest" give understanding a phenomenal description — to understand is to dwell with the named as named — and the anti-Platonic point reaffirms the conventionality (non-φύσει character) of speech established earlier.

It cannot really become a problem, Heidegger continues, how ὄνομα and ῥῆμα find themselves together into the λόγος, for λόγος is precisely the originary, and ὄνομα and ῥῆμα must be understood as particular modifications of the λόγος. For the ὄνομα it is characteristic that it cannot be split into meaning-characters; the word as name is in the unitariness of meaning that we designate as "naming something." There are compound words that also have a unitary meaning, but such that the components want to mean something self-standing — and not only to mean something but to mean something with a view to the unitarily meant. The free discretion refers to the act of language-creation itself and so need not be alive in every enactment; we do not come into the world with a determinate stock of words, nor are we gradually fitted into a fixed framework. The priority of λόγος over its parts inverts the natural-attitude picture: speech is not assembled from prior names and verbs; rather name and verb are abstractive modifications of an antecedent whole of meaningful speaking-with-the-world.

ῥῆμα, finally, is a word that, first, co-means time in its meaning, προσσημαίνει χρόνον — what it means, it means in a temporal being, the "to-be-sometime," for example "will die"; and second, means with a view to another being, for example "goes into the church," being always a sign of things said of another, ἐστὶν ἀεὶ τῶν καθ' ἑτέρου λεγομένων σημείον. Rhematic being is the being that is meant in the ῥῆμα. ὄνομα and ῥῆμα can grow only as modifications of the originary λόγος; they are still meaning for themselves, but something has been lost — the *how* of meaning changes: out of the κατάφασις becomes the mere φάσις. The closing point fixes the direction of the analysis: isolated noun and verb are privative, fallen-away modes in which the asserting, world-disclosing character of κατάφασις has been lost and only bare saying, φάσις, remains. This privation-structure mirrors the darkness/στέρησις analysis of §1 and prepares the account of disclosure and deception in §2b.

b) The pointing-out speech (λόγος ἀποφαντικός), which uncovers (ἀληθεύειν) or covers over (ψεύδεσθαι) the existing world in addressing-to (κατάφασις) and speaking-away (ἀπόφασις); the ορισμός

Heidegger approaches κατάφασις on a detour. The λόγος is not like a tool; it is historical and arises freely, out of a given state of the matter's disclosedness. Not every speaking is one that, in the manner of a meaning, accomplishes a pointing-out of something; only that speaking is ἀποφαντικός in which something like ἀληθεύειν occurs — giving beings as unconcealed, or giving beings such that in this pointing-out something is "feigned," ψεύδεσθαι. Covering-over feigns something in the manner of pointing-out. ἀληθεύειν and ψεύδεσθαι are the basic ways in which the λόγος as ἀποφαντικός points something out, and it shows beings as beings. When the λέγειν is carried out in ἀληθεύειν — uncovering — then the λόγος is a λόγος ἀποφαντικός; that is, not every λέγειν (questioning, commanding, requesting, drawing-attention) is "true and false." Yet every

such speaking is making-manifest, *δηλοῦν*, which must not be confounded with theoretical uncovering — whereas today one seeks to understand all knowing from the judgment as a modification of it. Three of the lecture's most important theses are concentrated here. Truth and falsity (*ἀληθεύειν/ψεύδестhai*) are not properties of judgments but ways of *uncovering* and *covering* beings; the assertion (*λόγος ἀποφαντικός*) is only one *λέγειν* among many (questioning, commanding, requesting), so its later monopoly is historically contingent; and all *λέγειν* is *δηλοῦν*, manifesting, which must not be reduced to the theoretical-judgmental uncovering. The polemic against "understanding all knowing from the judgment" is aimed at the whole logical tradition and is the seed of the *Sein und Zeit* §33 derivation of the assertion from a more original disclosedness.

He then corrects a standard misreading of Aristotle's phrase "there will be affirmation or negation if something is added," *ἀλλ' ἔσται κατάφασις ἢ ἀπόφασις, ἐάν τι προστεθῇ*. One interprets this as though a sentence arises when further words are added to a main word. But *πρόσθεσις* stands in Aristotle opposed to *ἀφαίρεσις*, abstraction, which means taking something away from something and setting it on itself as taken-away — geometry, for instance, looks away from a thing's other features and keeps the bare spatial shape in view. *πρόσθεσις* means concretion; but it is not that the taken-away is added back — rather the posited is posited *as being*, as a being. The *κατάφασις* is alive beyond mere *φάσις* when what is meant in speaking is meant as concretely existing. A *λόγος* is then there when the speaking is a speaking *with* the existing world. With "stove" I do not speak out of a being-there; rather I step out of the being-there of the concrete world, I mean something, but for this meaning it plays no role whether stoves actually exist. Speaking is a being-with-the-world, something originary, and lies *before* the judgments; from here the judgment must become intelligible. The correction is decisive for the whole reading: *πρόσθεσις* (concretion, positing-as-being) is opposed to *ἀφαίρεσις* (abstraction), and assertion is not word-addition but the letting-be-encountered of a being as existing — speech as being-with-the-world precedes and grounds the judgment, rather than the reverse. The example of "stove" spoken in isolation versus "Fire!" shouted to wake sleepers shows that the unit of *λόγος* is not a plurality of words but the addressing of what is encountered as it is encountered; it is logical tradition that misreads the cry "Fire!" as a judgment.

Heidegger recapitulates: *λόγος* as speaking has been characterized from three sides — from *φωνή μετὰ φαντασίας*, as meaning-bearing sound, and as the bringing-to-a-stand. Speaking is no property like "having hair"; it co-constitutes the specific existence of the human: the human is in the world such that this being speaks *with* the world *about* it — where "about" does not mean judging (the "about the world" lies, for example, in the "today": please come to me today). He then specifies the pointing-out function against the *φαινόμενον*: the *λόγος ἀποφαντικός* is a speaking-with-the-world through which the

existing world is pointed out as existing — ἀποφαίνεσθαι is to let be seen from itself in its so-being-there. But the λόγος ἀποφαντικός is merely one possibility beside others of speaking about the world with the word. Citing *De anima*, the λόγος is a possibility of the human's being that aims at bringing him to his highest possible existence, εὖ ζῆν; from here one can come to say that life equals being-possible, having quite determinate possibilities. Here Aristotle speaks no longer of λόγος but of διάλεκτος — speaking with others about something — or of ἐρμηνεία, making oneself understood with others about something; and out of this grows a fundamental definition of human being: to be human means that such a life has the possibility of dealing with the πράγματα, with the world as something to be taken care of, and indeed a being that can speak; the being is in its πράξις essentially characterized as speaking. The pointing-out assertion is thereby firmly relativized: it is one comportment within a life whose being is concerned with dealing-with and speaking-with, ordered toward εὖ ζῆν; the classical definition of the human is reread through διάλεκτος and ἐρμηνεία as the speaking, communicating being-in-the-world.

The question of the *unity* of the λόγος ἀποφαντικός is then taken up, and Heidegger stresses that for Aristotle and the Greeks the determination of unity, of the ἓν, alternates with the determination of the specific being of a being — so the question of unity is bound to the question of being in the sense of being-there. Unity is to be uncovered in two respects: with regard to the meant, and with regard to the factual meaning. *Ad 1*: how does the λόγος ἀποφαντικός differ from ὄνομα and ῥῆμα? As against any mere name, the λόγος is πρόσθεσις; the named is left undifferentiated as to its being, whereas the meant in the λόγος is characterized as existing. Meaning in the name is mere meaning in the formal sense; in the λόγος it is the pointing-out of the existing as existing. He cites the *De interpretatione* point (which, the editor notes, Heidegger ascribes to Hegel but probably means Husserl): a verb spoken merely as a word is a mere name — something is meant, but in this name I am not placed before the being, and nothing is settled about the existence or non-existence of the meant, ἀλλ' εἰ ἔστιν ἢ μή, οὕτω σημαίνει. This indifferent being says nothing about the matter and its being as matter: οὐδὲ γὰρ τὸ εἶναι ἢ μὴ εἶναι σημειόν ἐστι τοῦ πράγματος. Rhematic being says nothing taken for itself; in itself thematic being is nothing — rather it co-means something like a composition, προσσημαίνει δὲ σύνθεσιν τινα. It belongs to every verb, to its proper meaning, that it means its meant as standing in connection with something else; through rhematic being a range of possible connections is marked out. The determination is itself indeterminate insofar as it does not determine unambiguously; in the meaning of every verb there is a determinate reference to thing-like connections, σύνθεσιν τινα, ἣν ἄνευ τῶν συγκειμένων οὐκ ἔστι νοῆσαι. The verb has relation-character, but such that this referential connection and its being is indifferent; over against this being-indifference, in every λόγος being-there is meant. The point

sharpens the ὄνομα/ῥῆμα-versus-λόγος contrast: the verb already carries a built-in reference to a context (σύνθεσις) but leaves the being of that context indifferent, whereas the assertion alone posits the matter *as existing* — being-there is meant only in the λόγος, never in the isolated word.

Ad 2: what makes up the specific unity of the λόγος ἀποφαντικός? The originary unitary λόγος ἀποφαντικός is the κατάφασις, with which the ἀπόφασις goes together, both characterized as ἀπόφανσις (affirmation and negation). κατάφασις: to speak something of something else *toward* something. ἀπόφασις: to speak something *away* from something — and in the ἀπόφασις lies a double ἀπό. The two do not simply go together: the whole state of affairs must first be retained in its proper being-there for any further determination; only then can one speak *away* from it, or from it speak something else away. Only so can one come to an understanding of the problem of negation. These λόγοι are simple because in them no connection of λόγοι takes place, as in the hypothetical sentence "if it rains tomorrow I will not go out." Although the λόγος is simple, it contains a ῥῆμα that says something with regard to something else; the ῥῆμα does not touch the originary unity of the λόγος, because in the λόγος no naming is contained — "the leaves are yellow" does not contain "are yellow"; in the λόγος what is spoken about is retained as existing. So the λόγος can consist of one word. Two things are secured: negation is founded on a prior holding-fast of the existing matter (one must have the matter in its being-there before one can speak anything away from it), so that the *positive* uncovering is more original than the negative; and the unity of the assertion is not a synthesis of independent word-meanings but the single pointing-out of one existing matter — which is why a one-word λόγος is possible.

Finally the ορισμός, definition, the distinguished λόγος. Seen only from outside we have here a manifold (human, living-being); but over against the ordinary λόγος ἀποφαντικός the ορισμός is distinguished in that what it says — the whole human — is not *attributed* to the human as existing as something else (after the manner in which yellow is attributed to the leaves), but what is here said by the λόγος about the being *is the being itself*. The existing thing is here addressed simply in itself, καθ' αὐτὸ λεγόμενον. In *Metaphysics* VII, chapter 4, where the ορισμός is analyzed, Aristotle comes furthest in the analysis of the immediate, an advanced position never again reached. The being of the world is there in speaking as existing, pointed out from the ground up, grasped in itself; in being asserted, its own being-there comes to givenness. Fundamental here is the correlation of λόγος and εἶδος; εἶδος is the look, that is, for the Greeks, its showing-itself, equal to "it is so"; as λόγος the addressed as such is also designated, and in Aristotle εἶδος and λόγος are interchanged. εἶδος is the existing in its look. In German we say "that is how you look" in the sense of "that is how you are." The ορισμός is thus the limiting case of pointing-out in which speech and the being coincide — the definition does not predicate something *of* the matter but says the matter itself —

and the λόγος/εἶδος correlation ties speech back to the self-showing (εἶδος) established in §1, closing the circle between φαινόμενον and λόγος: to say what something is, is to let its look show itself.

c) The possibility of deception, the λόγος ἀποφαντικός and αἴσθησις

Heidegger now poses the question that the whole word-history was meant to reach: wherein is the possibility of deception, of semblance, grounded, such that one could say there is in the world only *Erscheinung*? Speaking gives the possibility of having the world in its *Da*-character — it has in itself the possibility of access and of preserving. But the λόγος ἀποφαντικός is not the λόγος in general, not even the decisive one, even if in the history of thought's self-interpretation it has gained the upper hand and the leading role in all questions bearing on speaking, concept-determination, and the interpretation of *Dasein*. Unity has for Aristotle and the Greeks no merely formal sense such that every objective thing as such would be one; the question of unity is tightly bound to the question of being, being in the sense of being-there. The question of the unity of the λόγος ἀποφαντικός equals the question: what characterizes the λόγος ἀποφαντικός as one? It is *one* making-manifest, ἐν δηλοῦν — the meaning-function of the λέγειν, in which a being is pointed out as existing, determines the unitariness of a being. The single posittings are thoroughly dominated by the meaning-tendency of such a λέγειν that wants to point out a determinate state of affairs; one would not arrive at the λόγος if one wanted to begin with mere naming. The originary meaning-function is the pointing-out. The diagnosis is doubled: the assertion's historical dominance over all questions of meaning and interpretation is named as a *fact about the tradition* (and a distorting one), while the unity of the assertion is grounded not formally but in the single pointing-out tendency that governs the parts — meaning precedes and unifies, naming does not build up to it.

Drawing on *De anima*, Heidegger notes Aristotle's complaint that earlier philosophers attended far too little to the fact that the human moves in deception the greatest part of his time. Because deceit is far more at home in the human than one commonly believes, it does not suffice to make deceit a problem only in passing and not in principle; it is not enough, regarding the way the world becomes accessible, to mark off only αἴσθησις and νόησις — one needs an understanding of φαντασία, of the having-something-there. On the ground of the connections of φαντασία with αἴσθησις and νόησις, deceit and deception come about. This installs φαντασία (in the objective sense won in §2a, self-showing) as the hinge of deception: because the world *shows itself*, and shows itself in connection with perceiving and thinking, the very self-showing that gives access also opens the possibility of feigning. Deception is therefore not a malfunction added from outside but rooted in the structure of self-showing itself — the answer to the §1 puzzle of how φαινόμενον becomes *Schein*.

αἴσθησις as such is a marking-off of something against another, a distinguishing: in the grasping-out of something, the grasped-out is marked off as such against another, πρὸς ἄλλον. Something is perceivable in that it stands out against the co-presence of something else. The κρίνειν is not formal; in this marking-off the marked-off becomes graspable and accessible *as there*. This κρίνειν is constitutive not only of αἴσθησις but of νόησις; through these two possibilities the being of the human is distinguished. The human is a being that in its way has the world there in the manner of a marking-off self-making-accessible, standing in the possibility of self-movement, κίνησις κατὰ τόπον, in this marked-off and articulated way. The crucial move is the translation of κρίνειν away from "judging" toward "distinguishing/marking-off as there": perception itself discriminates and makes accessible, prior to any predicative judgment, and this discriminating is what the human shares between perceiving and thinking.

Under what conditions does the basic function of αἴσθησις, the κρίνειν, stand? Drawing on *De anima* III 2, the existing as living is characterized as a being-in-possibility, and indeed being-in-a-determinate-possibility — being able to do something, having quite determinate, delimited and prefigured possibilities of ability, ability with regard to the world in which this able-being has its being. Here δύναμις and ἐνέργεια have their origin; they appear already in Plato but not yet in fundamental meaning, whereas in Aristotle they belong to the categorial basic-determination of being. Life is thus defined ontologically as being-able, having determinate possibilities with regard to a world — the potentiality/actuality pair, raised in §1 for darkness, now grounds the very being of the perceiving living thing.

Every perceiving goes as such upon the ὑποκείμενον αἰσθητόν, the underlying, what is already there before any going-about-things in being-there. The ὑποκείμενον is for the Greek a beforehand lying-there; the lying-there does not first have to be made — the perceivable is a ὑποκείμενον, and perceiving makes up the specific access to this lying-there. Heidegger then takes up Aristotle's problem of the discrimination *between* the proper sensibles of different senses: each perception is of its underlying sensible, present in the sense-organ as sense-organ, and discriminates the differences of its underlying sensible — sight white and black, taste sweet and bitter. But we also discriminate white and sweet just as immediately as white and black; by what do we perceive that they differ? Necessarily by perception. One must not bring in here the opposition of thinking and sensibility; the being-different of these states of affairs is originarily *perceived*. Aristotle asks by what we are put in the position to grasp this otherness simply — evidently necessarily through perceiving, since both are αἰσθητά — and shows that it does not suffice to call in, say, the sense of touch: it cannot be by separated senses that one discriminates that sweet is other than white, but both must be manifest to some *one*, δεῖ ἐνί τινι ἄμφω ὁῖλα εἶναι. The point prepares the role of the unifying λόγος: the discrimination across sense-modalities cannot be done by any single

sense, and yet it is perceptual, not a super-added intellectual judgment — so something one must hold both together.

When I dwell in perceiving I have the white as such in seeing, the sweet as such in tasting; how do I come to perceive that the two are different? The thing perceived in tasting and the thing perceived in seeing must both be manifest *for one*, lie openly there in their what for one. The same holds when I see "green" and another sees "red": how is it that this state of affairs, which is one, is accessible and graspable for us in its unitariness? It lies already in the originary carrying-out of perceiving, in the way of its marking-off of the one against the other, that there is a *speaking*, δεῖ δὲ τὸ ἐν λέγειν ὅτι ἕτερον. The speaking is one with the manner of perceiving; speaking is already alive in this distinguishing. Only on the ground of possible mutual understanding does it succeed at all that a unitary state of affairs can be made accessible *for several* in its unitariness. The λόγος is here alive as communicating λόγος; the world becomes thereby accessible in its unitary articulation. That is the originary function the λόγος has as communicating: communication, *Mit-Teilung*, in the strict sense — when I speak out a determinately perceived state of affairs, out into the publicness of being-there — has the sense of making the addressed accessible to the other such that I *share* it with him; we both now have the same. Here too the medial sense of ἀποφαίνεσθαι is to be heeded: the medial says "for itself," for the speaker himself, such that the state of affairs becomes graspable and retainable for him as perceived. This is a rich result. The discrimination of qualities across senses already involves a λόγος intrinsic to perception; and the communicative λόγος, by which a perceived matter is *shared* in the publicness of being-there, is built on the same structure — anticipating the *Mitsein* and the publicness (*das Man*) of *Sein und Zeit*, and grounding objectivity in shareability rather than in private representation.

If the λόγος is even here still alive, it is all the more alive where perceiving moves in its natural way as αἴσθησις κατὰ συμβεβηκός. Here the selfsameness of time is required — the temporal being-there of the speaking together with what is perceived. That I can perceive such a perceivable of the world is grounded in my being simultaneous with what is to be perceived, ἐν ἀχωρίστῳ χρόνῳ. Temporality is nothing arbitrary if one wants to perceive something in the world, for it lies already in the sense of a perceiving and of a perceived that it is perceived as *now* existing. If I give expression to a perception, there lies in it at least unspoken that the perceived is now there. Time is for Aristotle not deduced; it is fetched from the state of affairs itself, as is its selfsameness. This is a quietly important moment: temporality enters not as an external frame but as belonging to the sense of perceiving-and-being-perceived — the now-character of the perceived and the simultaneity of perceiver and perceived are drawn from the matter itself, a procedure Heidegger explicitly approves and which prefigures his own derivation of time from the phenomena rather than by deduction.

The difference of "white" and "black" in perceiving does not come in through an argument; it becomes alive in speaking, and the αἴσθησις is a κρίνειν. One found it strange that in simple perceiving a λόγος should be met, and one foisted on Aristotle the opinion that already perceiving is a judgment. But αἴσθησις is not characterized directly as λόγος, but as something *like* a λόγος, οἷον λόγος τις. Heidegger then gives four characterizations of αἴσθησις. First, αἴσθησις is an ἀλλοίωσις, a becoming-other: insofar as the human, concretely living in his world, perceives something and the αἴσθησις is there in the human as a way of being and of his comportment to his world, Aristotle calls αἴσθησις an ἀλλοίωσις — in perceiving, the perceiver himself becomes another, insofar as he now in perceiving stands in a determinate way to his world. Second, αἴσθησις is a πάσχειν, an undergoing: the moment of ἀλλοίωσις is more closely specified — through perceiving something happens *with* the perceiver, in perceiving something happens to the perceiver himself. Third, αἴσθησις is a κρίνειν: in this marking-off the thing's look is explicitly taken up, but the αἴσθησις does not here step out of its mode of enactment; Aristotle designates the same connection, such κρίνειν, as a determinate way of speaking, λόγος τις. The λόγος has the function of pointing out the perceived as such; the *that* of the being-other, this state of affairs, is appropriated in the specific way of speaking. Perceiving has a peculiar way of speaking; it is itself one that speaks about several. Fourth, αἴσθησις stands in the middle, μεσότης, when we represent to ourselves the manifold of colors: αἴσθησις must somehow stand in the middle, not be fixed on one color, must be able to look to both sides — seeing stands in the middle of all colors and can grasp all colors equally well; the middle concerns the kind of possible grasping-ability. The being-character of perceiving is δύναμις: the being-able-to-perceive, having a determinate possibility, being such that the possibility exists of coming into the perceiving being. Having the possibility makes up a quite specific being of the living; from this basic determination all the previously named are to be understood. The four characterizations are not a list but a deepening: perception is a being-altered and an undergoing (so the perceiver is *changed* by the world), a discriminating-that-speaks, and a being-in-the-middle grounded in δύναμις — all gathered under being-able. This keeps perception ontological and existential, never a passive reception of data.

αἴσθησις is in a being that has language; with or without vocalization it is always in some way speaking. Language does not only speak along *in* perceiving — it even *leads* it: we see *through* language. Insofar as language is appropriated traditionally and not originarily, it precisely *covers over* the things — the same language that has the basic function of pointing the things out. So it becomes intelligible that in the being-there of the human, insofar as he has a being-there by having language, the possibility of deceit and deception is co-present. This is the culminating thesis of §2c and the direct answer to §2's guiding question: because we see *through* language, and because inherited,

non-originary language covers the very things it is meant to disclose, the possibility of deception is built into the linguistic constitution of human being-there. Truth and untruth, disclosure and covering, are co-original features of a being that has language — and the remedy is again the winning-back of language from the matters, the program announced in the Vorbemerkung and §1.

d) The three respects on the ψευδός. The factual being-there of speaking as the proper source of deception. Circumstantiality and elusiveness of the world

Heidegger turns to *Metaphysics* V, chapter 29, where Aristotle distinguishes ψευδός in three respects: as πράγμα ψευδός, a being-false touching the proper being of the πράγματα (we call things false — false gold); as λόγος ψευδής, the speech, the speaking is false; and as ἄνθρωπος ψευδής, the human is false. So the ψευδός concerns the world, speaking, the specific being-in-the-world, and the being itself. The threefold division is the framework for the rest of §2: falsity is not located first in the proposition but is distributed across the matter, the speech, and the human being — and Heidegger will argue these three are dependent and point back to a single root in the factual being-there of speaking.

The marking-off attitude is already as such a pointing-out (so not a judging); a being is to be shown as existing. Every marking-off is, in its pointing-out tendency, a fixing, a determining of something as something; this thing fixed as the one over against another, on the basis of a definite content. "White" is in itself something other than "black." In this marking-off the "as," the being-other-than, is made explicit, whereby the being-other itself need not be thematic — the theme is the color itself, grasped under a peculiar emphasis and lifted out as such. The critical "as" springs out in the field of perceivability: blue other than red. But that is not yet the full "as"; the full "as" is the exhibiting one. There is a *doubling* of the as-character, covered over by language: the ἀποφαντικός-as shows itself in every speaking, but to each there is also added the critical "as." This is a subtle and important distinction (one that *Sein und Zeit* §33 will systematize): a *critical* "as" already operates in perceptual discrimination (blue-as-other-than-red), and an *apophantic* "as" operates in the pointing-out assertion (something-as-something) — and ordinary language covers over the difference, so that the assertion's "as" looks like the only one. Both are rooted in the pre-predicative marking-off.

How is the possibility of ψευδός grounded in the λόγος itself? ψευδός is the pointing-out giving-out of something as something; it is therefore more than mere covering, without giving it out as other than it is. In what respect can a matter be false as to its being as matter? Heidegger reads Aristotle's text: in one way a thing is false because it is not put together, or cannot be put together — as when one says the diagonal is commensurable, or that you are sitting (the one false always, the other sometimes), for so these are non-beings. First, then, a possibility of being-false lies in this, that

determinate thing-characters do not, on the ground of their state of affairs, permit being-brought-together. Second, there are beings that in their specific being have the peculiarity of giving themselves out as something they are not, or as characterized as they are not — as scene-painting (σκιαγραφία) and dreams: they are indeed something, but not that of which they produce the φαντασία. Here the possibility of deception lies not primarily in a perverted apprehension but in the being itself. The two cases keep falsity on the side of the *matter*: either thing-characters that cannot be combined (the incommensurable diagonal), or things whose very mode of being is to show themselves as what they are not (trompe-l'œil, dreams) — so that φαντασία, self-showing, is again the locus, and deception is grounded in the being, not merely in a faulty mental act.

How can one speak of a ψευδός in the case where the state of affairs called false *is not at all*? How does language come to characterize a non-being as false being? The example is the diagonal's letting-itself-be-represented through a determinate ratio. The states of affairs first give the appearance of being measurable; in what we encounter there is a determinate prospect that it has its being in this or that respect on this or that thing-ground. But insofar as it turns out, by demonstration, to be impossible, this character is taken away in order to characterize its being. Heidegger's point is that "false" here marks the *disappointing* of an appearance grounded in the matter: the diagonal *looks* commensurable, and the proof of impossibility retroactively stamps that look as false — falsity is the collapse of a genuine appearance, not the mere absence of a fact.

Each of the three meanings of ψευδός sees the state of affairs in a determinate respect, but so that the others are co-thought; the πράγμα ψευδές points to the λόγος ψευδής. Heidegger develops the Aristotelian distinction: for each being as such there is a single λόγος in which I can address the matter itself in its being — the ορισμός, the addressing through which a matter is driven into and fixed within its own being-limits. Then there are λόγοι through which I can address the matters in many respects: we see the things according to the circumstances, αὐτὸ πεπονηθός, in which we have to do with them. This circumstantiality of the state of affairs permits the λόγοι that address it to be *many*; and the false λόγος is, strictly, no λόγος of anything. Such λόγοι, in which I address a matter so that what I address it as I do not win purely out of itself but with a view to something else I already know — these respects themselves lie *outside*; what I look toward is something I must draw in when I determine the matter, and such a λόγος is never simple. The simple λόγος is that through which I determine the matter itself and do not step away from it. The structure is the kernel of Heidegger's theory of falsity: the single, matter-defining λόγος (ορισμός) is opposed to the many "free-floating" λόγοι that address a thing only in some external respect, and it is the *circumstantiality* of the world — the fact that things are given in changing practical contexts — that makes the manifold of λόγοι, and hence deception, possible.

He uses the occasion to dismiss a much-discussed traditional question: if for each being there is only one quite specific way of addressing, there can be no *contradiction*; insofar as there are only λόγοι each going upon its matter, there is no contradiction.

Contradiction moves in a quite specific dimension where it is not about the matter itself but where one merely *talks about* it. It is possible to address a being not only through the way it itself becomes accessible but according to some respect on others — as eight is double by the λόγος of the two. The many λόγοι deceive, one may say, throughout; but it can be that one of them *hits*. This is a striking subordination of logic to ontology: contradiction belongs to the derivative dimension of talking-about, not to the matter-defining λόγος, and truth is the λόγος that "hits" the matter, not formal consistency.

The third meaning, the ἄνθρωπος ψευδής, is the προαιρετικός — the one who, by choice, takes it upon himself to cover the state of affairs, such that it belongs to his existence; he brings such speeches into others, and his manner of dealing is such that he fundamentally leads astray those with whom he speaks. The false human is thus not someone who errs but someone whose existence is constituted by the deliberate covering of matters in communication.

How are the three meanings of ψευδός dependent on one another? To answer, Heidegger considers the concrete λόγος as that of a human living in a world whose πράγματα have the possibility of being addressed as ψευδός. He transposes the meaning ψευδός into the sphere of *factical being-there*: a human who, in speaking about the existing world as it encounters him, can lie. πράγμα, the human, and λόγος are three respects that address a peculiar basic phenomenon not seen by Aristotle. And he states the thesis the section is named for: *the factical being-there of speaking as such, insofar as it is there and merely insofar as it is there as speaking, is the proper source of deception*. The being-there of speaking carries in itself the possibility of deception; in the facticity of language lies the lie. This is the decisive deepening beyond Aristotle: the three senses of falsity converge on a single root, the factical existence of speech itself, and Heidegger claims to see a basic phenomenon Aristotle did not — that deception is not an accident of speech but belongs to speech's very being-there.

He then tries to bring nearer what facticity of speaking is. It is spoken among existing humans in the *Mitwelt*, the with-world. Speaking as such, the factical of speaking, is from the outset apprehended as: it is spoken *about* something. This speaking that is now there is taken in the sense that it has the tendency to *say* something; it stands in public regard. So speaking is from the outset there with the being-there of speaking humans, and is in advance taken as pointing-out of something — it has the natural and living claim to say something. Merely through the fact of vocalization something is made known, and with that the possibility is present, in being-there, to *hide* something, insofar

as I say something other than I mean, but present what I say otherwise than it is. In this basic possibility of language lies the facticity of lying. The lying human can expressly take it upon himself to hide; he speaks so that what he says covers the state of affairs he speaks about. Here shows itself the remarkable thing that the one who lies must precisely *know* the state of affairs he speaks about — only if I know the state of affairs am I in a position to lie properly. The analysis grounds lying in the public, communicative being of speech (the *Mitwelt*) and in the gap between meaning and saying that vocalization opens; the paradox that the liar must know the truth shows that deception is a *founded* mode, parasitic on disclosure.

But this express tendency of hiding life need not be there. It is possible to point out a life that does not live in the tendency to cover the objects but only talks-along in publicness; this talking-along, *Dahinreden*, deceives merely through the fact of speaking itself. The proper opposite to speaking is not false-speaking, deceiving speaking, but *silence*, *Schweigen*. The tendency expressly to deceive can recede, but so that, more or less consciously, the speech is carried out in an *estrangement* from the matters — that is the specific speaking-out through many λόγοι. The possibility of deception lies here too in the fact of utterance, alive in a mis-seeing that is not motivated by carelessness of consideration but lies in the way the existing lives and the world itself encounters. Speech can have the positive tendency really to give the states of affairs, yet speak within a mis-seeing, the states of affairs not properly appropriated. Through language itself we live in a quite determinate apprehension of things — Heidegger quotes Nietzsche: "Every word is a prejudice." This is the introduction of *Gerede* (idle talk) and *Schweigen* (reticence) three years before *Sein und Zeit*: the everyday mode of speech, talking-along in publicness, deceives *without intending to*, by carrying inherited apprehensions ("every word is a prejudice"), and the genuine counter-possibility is not correct assertion but silence. Mis-seeing is grounded in the way existence lives, not in negligence.

A further motive, besides circumstantiality, for why we mis-see or do not always address the states of affairs as such, lies in the being of the world that Heidegger calls *Entgänglichkei*t, elusiveness: things are there in a quite peculiar character of *not-being-there*. Elusiveness lies in the being of the world itself, to which phenomena belong what we came to know as brightness and darkness; that there is fog, for instance, is no irrelevant fact one might cite as an example in epistemological inquiries. Elusiveness belongs to the existing world as existing. Things can elude us — which does not mean they vanish; the elusiveness becomes alive through their encountering us in *circumstantiality*. We do not see the things as matters that are the object of a scientific inquiry; this being-there of things is much richer and offers far more changing possibilities than the thematically prepared. Because the world in its richness is there only in the respective concretion of life, elusiveness too is far more comprehensive, and

with it the possibility of deception: the more concretely I am in the world, the more real the presence of deception. This couples two ontological features of the world — circumstantiality (givenness in shifting practical contexts) and elusiveness (the world's capacity to withdraw, fog being the paradigm) — to deception, and inverts the epistemological cliché: deception increases with concrete engagement, not with carelessness, so the disengaged theoretical attitude is not the cure but a flight from the richer, more deceptive concrete world.

How, then, does one come to call the *things themselves* deception? So far only that deceiving lies in speaking; why do we not content ourselves with addressing non-being as non-being — why do we say "false" with a surplus of meaning? When one says the measurability of the diagonal with the side is not, this being is false, one must not take such a sentence in isolation but from the connection out of which it is drawn. These sides are mostly known on average as measurable; they look measurable and give that appearance, but in fact they are nothing of the sort. This their non-being, which awakens the determinate appearance, is called false; this specific appearance such objects have is disappointed. So this use of *ψευδός* with regard to existing things, insofar as they are not, is grounded out of the unitary connection — already in the speaking-out, insofar as speaking has the tendency of pointing-out, lies the appearance that there is such a thing within a field where there is something measurable. But within this speaking lies that the speaking is not a pointing-out *from* a being but merely *means* what it speaks about; it means the states of affairs merely as such. Here lies the phenomenon of Husserl's *nominalization* and *neutralization*: we can speak out sentences as merely meant. Insofar as such speech directs itself to the nearest appearance, what it says is false; it deceives in the proper sense. The deep point is that the "false" applied to a non-existent matter is not a category mistake but is grounded in the same root: assertion that merely *means* (neutralized, in Husserl's sense) rather than *exhibits from the matter* generates the appearance that then gets disappointed. Heidegger ties his analysis to Husserl's *Ideen* / notions of nominalization and neutrality-modification, signaling continuity even as he relocates them in factual being-in-the-world.

One sees here the difference between deceit and dream: the dream has the being-there on the ground of which it deceives. The *λόγος* as apophantic *λόγος*, taken in its factual being-there, is something that bears in itself the possibility of deception; and insofar as the *λόγος* can characterize the being-there of the human, it dominates all the human's dealing with his world, all seeing, interpreting, speaking-out. The section closes by universalizing the result: because speech pervades all human comportment to the world, the possibility of deception built into factual speech infects all seeing and interpreting — there is no comportment to the world that stands safely outside the reach of covering.

e) Speaking and the world in their possibilities of deception. The meaning-shift of φαινόμενον to *Schein*

This λόγος, which bears with it the basic possibility of deceiving, makes it that all perceiving is in the danger of mis-taking itself, insofar as it is dominated by language. That is: the φαινόμενα, as existing in the factual world, are that with respect to which the human for the most part mis-takes himself — what first shows itself so simply is now something that only *looks* so, that *seems*. It is no accident that in Aristotle, where φαινόμενα says the existing itself as the ground for further research, it can also mean the merely-so-looking, φαινόμενον ἀγαθόν, the apparent good. This meaning-shift of the word φαινόμενον — once "the self-showing existing itself," then "the merely-so-looking, properly non-existing" — points, insofar as it is in the sphere of dealing with the world, to the basic fact that in being-there itself error and deception are interwoven in a quite fundamental way, and do not occur in the world merely as a bad property one must overcome. This is the explicit resolution of §1's guiding puzzle. The very same Greek word carries both senses — the self-showing being and the mere semblance — and the duplicity is not lexical accident but registers an ontological fact: error and deception belong fundamentally to being-there, not as a defect to be eliminated but as a structural possibility of a being that has language and a world.

Speaking as vocalizing is, insofar as it is, the possibility of deception — and this speaking taken as being in a world that in its specific being-character *offers* possibilities of deception, so that in the whole of the being-there of the world an inner connection subsists that is the being-possibility of deception. Speaking, insofar as it is there in the world, has a definite standing that no reflection examines further; the being-there of the human is taken in the respect that through speaking something is said, and speaking carries in itself the claim to communication. Speaking is so there that the speaker has various possibilities of concealing himself in speaking: the expressed, in which the speaker speaks in the express tendency of lying; and the tendency to feign, through speaking, that one's speech is backed by real knowledge of the matter. Even where a tendency opposite to the lie is there, the possibility exists of deceiving through speaking and the words. Heidegger separates the two sources cleanly: deception is offered both by *speech* (whether by deliberate lying or by the pretense of competence) and by the *world*, and even sincere speech is exposed to the second.

This speaking with its possibilities of deception stands as such in a world that for its part offers possibilities of deception: first, in that the world is characterized by circumstantiality, the objects we deal with being there for us in their concretion according to the respective situation, so that a manifold of discussabilities offers itself; second, in that the world is characterized by elusiveness, obstructed by fog, darkness, and so on — such states of affairs belong to the being of the world itself. Further there

are being-possibilities that deceive on the ground of their specific being, like dream. There is further, for speaking, the danger that it is there *with* other speaking, that it becomes a speaking-after, is a speaking-along — a peculiar dominance that language exercises insofar as it crowds out the dealing with the matters. So a manifold interweaving of the possibility of deception, as a being-possibility, shows itself with the being-there of speaking and the being-there of the world. We notice that precisely *speaking* hides the matter. Insofar as access to what is first there is factually led through speaking and the opinion about the things, precisely the existing world is hidden and encounters in a determinate giving-itself-out. Insofar as the world is there in this possibility of showing itself, this possibility of the world inverts into its opposite: to give itself out as something. The appearing in the originary sense of self-showing becomes *Schein*, semblance. It matters, for the matter itself, to understand this possibility of the meaning-shift of the term φαίνόμενον into the meaning of the merely-so-looking. The section consolidates the whole chapter: the world's very power to *show itself* is also its power to *give itself out as* something, and the dominance of inherited, repeated speech (the "speaking-after," again *Gerede*) crowds out dealing with the matters so that the self-showing world is precisely covered — the self-same structure that grounds disclosure grounds semblance, and φαίνόμενον tips into *Schein*.

f) σύνθεσις and διαίρεσις as the domain for the possibilities of the true and the false

It remains only to assure ourselves how far Aristotle had an express consciousness that deception has its field where the things are given in a determinate apprehension — that the possibility of deception is not grounded where a simple going-toward the things takes place, but where the world is there in the character of the *so-and-so*. Heidegger cites *De interpretatione*: περὶ γὰρ σύνθεσιν καὶ διαίρεσιν ἔστι τὸ ψευδὸς τε καὶ τὸ ἀληθές — in the domain where there is such a thing as combining and separating, there is both the true and the false. And from *De anima*: the perceiving of the proper objects of a sense (ἰδία) is always such that it gives what it perceives in itself, and is always true; the ψευδὸς is present only where there are λόγοι — διανοεῖσθαι δ' ἐνδέχεται καὶ ψευδῶς. There subsists the connection between the necessity of the constitution of the world as determined in a manifold of possible respects and the possibility of a deception. The speaker always speaks in a certain respect *upon* something. The localization of truth and falsity in σύνθεσις and διαίρεσις (combining and separating) confirms Aristotle's own insight that falsity belongs to the domain of the determinate "as," not to simple perception of the proper sensibles — which are always true — so that wherever λόγοι and the manifold respects enter, there deception becomes possible.

Pure seeing, like the mere naming of something, is a simple going-toward: I let them simply stand as given, I see the color as a simple taking. But ὅταν δὲ ἡδὺ ἢ λυπηρόν — when by contrast we perceive something gladdening or grieving, then the perceiving is

a speaking that apprehends the things *as* something, κατάφασις or ἀπόφασις. The perceiving, when something gladdening encounters us, is sudden, at a stroke; therein the perceiving and the seeing self-rejoicing are *one*. In the middle, μεσότης, this unitary perceiving is there. Insofar as this perceiving is the most originary — insofar as the things of the world are πρακτά, πράγματα — the natural access is a ἡδεσθαι or λυπεῖσθαι, a being-pleased or being-pained. These states of affairs one does not see so long as one holds to certain kinds of *Erlebnisse*, psychology, and so on. This is the chapter's final and most forward-pointing stroke. The most originary access to the world is not neutral seeing but affective: the things are πράγματα, things of concerned dealing, given primarily in being-pleased and being-pained, and the apprehending "as" is already alive in this affective taking. Here is the seed of the *Befindlichkeit* (attunement, mood) of *Sein und Zeit* §29 — that mood is a primary mode of disclosure — and Heidegger again names the obstacle: the modern frame of *Erlebnisse* and psychology, which cannot see these phenomena. With this the first chapter closes, having carried the word φαινόμενον from "self-showing being" through "ground of science" to its tipping into "semblance," and having shown λόγος to be the originary, world-disclosing yet deception-bearing comportment of a being whose deepest access to its world is affective concern.

Chapter Two: Contemporary phenomenology in Husserl's self-interpretation

§ 3. Making present the states of affairs won in the Aristotle interpretation. Anticipatory grasp of the predominance of the care for the idea of a certainty and evidence before the release of the encounterability of fundamental states of affairs

Heidegger gathers the result of the Aristotle interpretation under two heads. First, determinate states of affairs pointing in the direction of the being-there of the world and of the being-there of human life: the being of the world has the character of showing-itself, and the being of life has the basic possibility of speaking about being-there such that being is pointed out through speaking — the two bound by the being of speaking. Second, the being-there of the world can tip into a giving-itself-out, and the λόγος can be one that obstructs being-there; the connection shows a *Verhängnis*, a doom lying in being-there itself, that with its being the possibility of deception and the lie is there. This recapitulation fixes what the whole word-history yielded: not a lexical result but two ontological characters of world and life, plus their built-in liability to covering — the doom that will be traced, in the rest of the lecture, into the history of philosophy.

The interpretation, Heidegger stresses, was never aimed at making the development of a term intelligible in anecdotal form; it was meant to awaken a concern for the matters themselves, in such a way that at first it was not yet clear where things were heading.

What we must learn is to be able to read and hear in the manner of *waiting*. This is a methodological self-description of the whole course: the regress through φαίνόμενον and λόγος was not philology but a way of awakening the reader to the matters, and it demands a patience that does not prematurely fix the result — the same demand for enduring uncertainty made in the Vorbemerkung.

The interpretation has a matter-background: to make intelligible what is today known under the title "phenomenology" — that is, of what matters this discipline treats, what kind of matters contemporary phenomenology claims to work on. To gain their kind we ourselves need a horizon of matters, and from this horizon we shall decide how far the states of affairs of contemporary phenomenology still stand in connection with what we have substantively exhibited. Heidegger thereby frames the Aristotle interpretation as the horizon against which Husserl's phenomenology will be measured: only by first winning the Greek φαίνόμενον/λόγος can one judge whether what Husserl calls phenomenology has held fast to, or fallen away from, the matters.

He then states, in advance, the governing thesis of the whole lecture. The further development in the winning of the states of affairs of philosophy, and the motivation of the various ways in which they were worked, is led by the predominance of an *empty and thereby fantastical idea of certainty and evidence*. This predominance of a determinate idea of evidence is predominance *before* any genuine release of the being-able-to-be-encountered of the proper matters of philosophy. The care for a determinate absolute cognition, taken purely as idea, gets the predominance before every question after matters that are decisive — that is, the whole development of philosophy *turns itself around*. Beginnings are already there in Aristotle and the Greeks, not by accident: for example, that the being-there of the world as it shows itself is taken as the specific world of *semblance*, so that henceforth all decisive questions of philosophy are won purely out of the idea of gaining an absolute certainty, with the tendency to *overcome* the being-there of the world as something contingent. And this arises not out of attempts to win a peculiar mode of access of a science, but out of the idea — out of, so to speak, the intelligence become deranged, which invents a being-there for itself. This is the thesis the entire course exists to demonstrate, and it should be read carefully against the third misreading-guard. The *Sorge um erkannte Erkenntnis* — here named as the care for an absolute, certain cognition taken as a mere idea — is not yet the existential *Sorge of Sein und Zeit*; it is a *deficient*, deranging predominance in which an idea of science (certainty, evidence) is set *before* the matters and dictates what may count as a theme, inverting the proper order in which a matter assigns its mode of treatment. The striking phrase "intelligence become deranged, which invents a being-there for itself" names the pathology: cognition that, severed from the matters, fabricates its own object.

Heidegger then specifies what the inversion costs. The predominance of the care for an empty, fantastical certainty and evidence before all release of the encounter-possibility of fundamental states of affairs has pushed away what was originally the theme — pushed it away so far that not only did the thematic field drop from view, but, far worse, the choice of the field of vision was led not by some appropriation of the matters but by a determinate *idea of science*: the idea of a determinate cognition determines the theme, instead of the reverse, that a determinate matter-relation assigns the scientific possibilities of treatment. With that a traditional representation of "introduction to a science" is warded off: it does not matter to gain an empty knowledge of what the "object" and "method" of the named science are; method must take shape through the engagement with the matters. The point doubles as the methodological self-justification of the course's title, "Introduction to Phenomenological Research": the introduction is not a survey of object and method but a being-led-back to the matters out of which method first grows — and it diagnoses the modern inversion in which a prior idea of rigorous science selects the field rather than the field assigning its method.

Looking more closely at what has so far been won, something surprising shows itself. We have seen being-there with regard to a peculiar way of showing itself; of its content-character we learned nothing, seemingly fixing only an empty determination. We did not win what an *object* is; we learned about being-there a determination characterizing it in its *Wie*, its how — the how of showing-itself-of-itself and the how, grounded therein, of hiding-itself. Likewise with the λόγος: we learned only a determinately characterized way of its being — once to point out being-there, then to obstruct it. This being-there was not determined content-wise in the sense of nature-being or historical actuality, but in a seemingly empty way: only a *Wie* of being-there. And precisely by stressing these characteristic determinations of being-there as a *Wie*, the interpretation has already gone *beyond* what was graspable for the Greeks within their being-there-research. This is an important self-location. Heidegger concedes his reading is "formal" — it gives the *how* of being-there, not a *what* — but insists this is not emptiness but the very advance over the Greeks: the Greeks grasped being in *what*-determinations, while the analysis of the *how* (self-showing, self-hiding) reaches a level the Greeks could not thematize, the level on which *Sein und Zeit* will operate.

To make this clear, Heidegger lists the Greek *what*-determinations of being-there, the "world-categories": πράγματα, the things with which "one" has to do; χρήματα, things insofar as they stand in use for the needs the being-there of the world itself motivates and requires; ποιούμενα, the things in the world that are produced, made, available as ἔργα for the first two; φυσικά, the existing of the world that is not produced but is of itself, on the basis of its specific being, yet at once a possible *whence* of producibility (wood, ore) and so related to the produced; μαθήματα, the being that has the specific

character of learnability, that about which there is a knowledge teachable to anyone without his having a practical relation to the matters; and, within these characters, the distinguished things having the being-character one designates as οὐσία. He recovers the homely sense of οὐσία: the seemingly abstract philosophical concept means *Habe*, holdings, the means, what is at home around me, the "estate," *Anwesen*. The catalogue is doing real work for the lecture's whole argument. The Greek categories of the world are drawn from *concernful dealing* (things handled, used, produced, growing, learned), and οὐσία — the master-concept of being — originally means *presence/holdings*, *Anwesenheit*. This grounds Heidegger's later thesis that the inherited sense of being is "presence," and it sets up the contrast: in his own interpretation these world-categories did *not* appear — "we have heard only of φαίνόμενα." οὐσία gives the basic character of beings as being, presence, tacitly co-meant in all the "thing"-concepts; φαίνόμενα gives the *nearest mode of encounter* of beings according to their formal *how*, the self-showing. φαίνόμενα is precisely the being addressed in all those characters, but taken only in the respect of showing-itself — and the untroubled grasping of beings in this nearest mode of encounter must somehow be phenomenologically decisive.

§ 4. Consciousness as the theme of contemporary phenomenology

Heidegger poses the question: what is the theme, the matter-being-connection, that is the object of the research today called phenomenology? He gives first a wholly formal determination following Husserl's farthest-driven position in the *Ideen*: phenomenology is the *descriptive-eidetic science of transcendently pure consciousness*. For him this is important only as a pointer that in phenomenology *consciousness* is the theme of consideration. The question then arises: how does what is called consciousness come to the peculiar priority of furnishing the theme of a fundamental science such as phenomenology claims to be? Can we make this priority intelligible out of what we have so far come to know — intelligible such that we show: the being-field named consciousness comes to this priority not by accident or arbitrariness, but its priority is grounded in peculiar possibilities that being-there carries in itself and that are already prefigured in Greek philosophy? Here the method of the whole course is stated programmatically. The aim is not to report Husserl's definition but to *derive* the priority of consciousness from possibilities of being-there itself — to show it is neither arbitrary nor self-evident but historically grown from the Greek beginning. Note the careful, immanent stance toward Husserl (the sixth guard): consciousness is not rejected but its very *thematic priority* is made a problem, something to be explained rather than presupposed.

If this proof succeeds, Heidegger continues, we win the insight that these transformations are themselves grounded and motivated in our own being-there, and that the history offering us such possibilities and transformations is not something

contingent and laid-aside, lying behind us, drawn in for occasional illustration, but that in the transformations of history nothing other encounters us than *our own being-there*. This consideration is therefore not a historical narrative but the concrete glimpse into quite determinate possibilities of our being-there; when these are exhibited and seen together with the foregoing, we win the ground for a fundamental *distinction* to be carried out at the beginning of our inquiry. This states the conception of history that governs the whole *Destruktion* (the seventh guard): historical interpretation is not antiquarian narration but the appropriation of the possibilities of one's *own* being-there — the past is not behind us but is us — and it sets up the "fundamental distinction" (between the proper being of the matters and the inherited idea of science) toward which the Husserl-critique drives.

a) Greek philosophy without a concept of consciousness

How does it become intelligible that something like consciousness is the theme of philosophy? The question becomes fundamental the moment we recall that the Greeks do not know anything like consciousness: there is in Greek philosophy *no concept of consciousness* — though something co-conceived under today's specific phenomenological concepts of consciousness is precisely found among the Greeks. Aristotle saw, in analyzing perceiving, that we co-perceive a seeing itself as a being — we have an αἴσθησις of seeing — and posed the question what kind of perceiving it is by which we perceive the seeing and the like; likewise for νόησις, and again the question whether the meaning that means the perceiving is of the same being-character. Both questions remain undecided. Heidegger reads this undecidedness as a *more* fundamental insight than the over-hasty decision of modern psychology, which takes the perceiving of seeing, of meaning, and so on, to be one and the same, *inner perception*. However one would decide these things, the perceiving of self-comportment has become a theme; but what is here perceived must not be interpreted as *Erlebnis* or psychic being-there in the modern sense. The guard against the modern frame is reasserted at the decisive point: Aristotle's noticing that we are aware of our own seeing is *not* a doctrine of inner perception or of lived experiences, and reading it so (as modern psychology does) is the over-hasty decision Heidegger refuses; the Greek's leaving-open is the more honest phenomenological stance.

Nevertheless later Greek philosophy shows an acquaintance with what is today called consciousness or self-consciousness — an acquaintance won not on the path of philosophical reflection but drawn from the natural experience of what we today call, in a very stressed sense, *Gewissen*, conscience, συνείδησις. So it enters Christian life-consciousness and undergoes further explication in theology. But what is thereby designated is in no way an *object of consideration*; that something like consciousness became the theme of an inquiry is excluded for the Greek and Christian consciousness.

The genealogy is important: the phenomenon behind "consciousness" first appears as the *moral-religious* phenomenon of conscience (συνείδησις, *conscientia*), lived in Christian existence and explicated in theology, but never *thematized as an object*. The thematization of consciousness — its elevation to the field of a fundamental science — is thus a later, specifically modern event, whose origin the lecture will trace to Descartes.

b) The breakthrough of phenomenology in Husserl's *Logische Untersuchungen* and its basic tendency

To understand the tipping-over of the thematic field from beings-as-world to the beings of consciousness, Heidegger sketches the end-station, contemporary phenomenology, in the traits needed for the consideration. The research we call phenomenology first stepped forward under the express title *Logische Untersuchungen*, moving within a traditional discipline, logic. Personally these themes lay near for Husserl, since he was driven from mathematical investigations to logical considerations in the effort to understand the peculiarity of mathematical thinking. The *Logische Untersuchungen* have not the ambition to work out a new textbook of logic, but the basic intention, once and for all, to make the objects with which logic occupies itself into a theme such that a research related to them is put in the position really to *work on matters* — that the specific objects of this discipline are brought to a specific, exhibiting *Anschauung*, intuition. Intuition means here merely: to make the object itself present, as it shows itself. To make this *Vergegenwärtigung* a methodically secured one is the basic tendency of the *Logische Untersuchungen*, and as such a tendency it could work itself out genuinely only on the path of matter-disclosing research. These investigations fertilized contemporary philosophy in a measure that can no longer be gauged — of which even those it influenced are barely aware. The whole course we are pursuing takes its start from the *coming-up-to-the-things-themselves*, working through a mere word-knowledge to the things. This is Heidegger's positive estimate of Husserl, and the basis of his immanent critique. The "breakthrough" of the *Logische Untersuchungen* is the maxim "to the things themselves," understood as the demand to bring the objects to self-showing intuition — and "intuition" (*Anschauung*) is deflated to its phenomenological minimum: making the object itself present, as it shows itself, which is exactly the φαίνόμενον-sense won from Aristotle. Heidegger aligns his own course with this tendency, so that everything critical to come is a holding of Husserl to his own best insight.

c) The direction of Greek philosophy and the question of its tipping-over

How does it come about that consciousness forms itself as the field of research? From the definition it follows that consciousness becomes the object of philosophy *in a quite determinate purification*; consciousness does not without further ado become a possible

theme. What motives can be given for consciousness needing a purification in order to become the possible object of a fundamental science? Two questions are thus to be answered: how does it come about that consciousness is posited as theme, and how does it come about that it needs a purification? The doubling is structurally important for the Husserl-critique: it is not enough that consciousness becomes a theme (a Cartesian event); it must be *purified* (transcendentally and eidetically reduced), and Heidegger will argue that this purification is governed by the care for certainty rather than by the matter — so both the *positing* and the *purifying* of consciousness carry the inherited deformation.

To understand the peculiarity of this consideration, we must constantly hold present what we won in the Aristotle interpretation. The enumeration of certain categories in which the Greeks characterized being was meant to win a first glimpse of the motives decisive for their research. These being-categories undergo, in the philosophical work of the Greeks, a peculiar and fundamental consideration, and from the kind of analysis of the being so addressed the direction in which Greek philosophy goes must come nearer; we want to see what of it remains alive in later philosophy. The manifold of beings is first divided by the Greeks into the being that always is and the being that can also be otherwise — a division concerning the whole domain of all beings. This basic division is alive in the four basic determinations of being, which for Aristotle do not lie in a *system* but are *living motives* in which the research moves: τὸ ὄν τῶν κατηγοριῶν (being according to the categories); τὸ ὄν δυνάμει–ἐνεργείᾳ (being according to potentiality and actuality); τὸ ὄν κατὰ συμβεβηκός (incidental being); and τὸ ὄν ὡς ἀληθές (being as true). Heidegger insists these are not a tidy doctrine but the live motives of inquiry, and he now reads each back to its root in being-in-the-world.

He glosses the four. The first is borne by the look toward the λόγος: κατηγορεῖν is a strengthened λέγειν, to say something to someone's face; the category is carried out in constant orientation toward the speaking-characterized possibility of being-there in which the surrounding world is "there." The second is drawn from the specific grasp of life itself, insofar as being-alive means being-a-possibility; both of the first two have relation only to *life as being-in-a-world*, where "life" is itself something that occurs within the world, and whose peculiarity is to be most properly itself in its being finished and present. In Greek ontology, which is an ontology of the *world*, it is precisely "life" (as being-in-the-world) that yields the distinguishing characters. The third, incidental being, embraces both the being-there of world and of life: the look rests on *circumstantiality*, insofar as this makes up the peculiar character of being. The fourth, being as true, strikes a basic phenomenon of being-there left uncharacterized by the Greeks — yet precisely here they were far further than today's epistemology; it springs from the look toward the peculiarity that the world is "there," that a being is in a world which world is "there," disclosed. So we see on the whole that all four directions are drawn from the

state of affairs of *being-in-the-world*; of consciousness nothing occurs, although in Aristotle there is something like a treatise *Περὶ ψυχῆς*. How, then, does it come to the tipping-over, so radical that what is named consciousness becomes the theme of the whole of philosophy? The reading of the four senses of being secures the lecture's pivot. Even Aristotle's *ὄν ὡς ἀληθές* — being as truth, the sense closest to "consciousness" — is rooted in the *disclosedness of the world*, not in an inner subject; all four senses of being are won from being-in-the-world. So the later elevation of consciousness to the master-theme is not a natural unfolding of the Greek beginning but a genuine *Umschlag*, a reversal, whose motivation must be exhibited — the task of the chapters on Husserl and, behind him, Descartes.

§ 5. The theme "consciousness" in the *Logische Untersuchungen*

a) The *Logische Untersuchungen* between traditional orientation and originary questioning

Heidegger takes first an external pass at how the work looks. What was undertaken in the *Logische Untersuchungen* is on the one hand wholly traditional, and on the other conceals something originary and most remarkable. The investigations want to be preliminary works that first seek to bring the object of the discipline into view, as though it looked as if sciences were being pursued that have no object at all — and it not only looks so but is so, that one holds to pure word-concepts and shifts them against one another. What then is science? The diagnosis is the same one made in the *Vorbemerkung* about philosophizing in words: a whole discipline (logic) can be carried on without its objects ever being brought to self-showing, and the *Logische Untersuchungen* are great precisely because they make that scandal visible and demand the objects themselves.

The traditional orientation is also strong. In that time tendencies had grown powerful that aimed at giving logic and epistemology a scientific foundation by underpinning them with a psychology; insofar as phenomenology's first work proceeds partly in connection with, partly in critique of, these tendencies, a determinate traditional orientation is present. But the peculiar thing lies in the *way* a foundation for logic is sought: in the way that one wanted to make present a state of affairs in which all objects of logic become findable and questionable, so that logic would have a determinate *milieu* in which it moves. For the psychology of that time the object-field was not the "soul" — and "soul" not in the ontological determination relative to the being of the living — but *consciousness*. Two things are fixed here. The originary impulse of the *Logische Untersuchungen* is the demand for a *field* in which logic's objects can actually be found and interrogated (the demand for self-showing), and the discipline that claimed such a field, psychology, had already replaced the ontologically-rooted "soul" (being of the living) with "consciousness" — so the very term in which the field gets cast is already the modern, un-Greek one whose pedigree the lecture is questioning.

b) Ideal meaning and meaning-acts; empty meaning and meaning-fulfillment; consciousness as region of *Erlebnisse*; intentional *Erlebnisse* as acts; consciousness as inner perception

Heidegger now makes clear from the matter how the attempt to work on determinate objects of logic demands that one secure and bring into view what is called consciousness. Logic has by tradition as its theme: concepts, judgments, inferences. These are something meaning-like, standing in connection with the linguistic expression, which is not something accidental, for all thinking and knowing, all theoretical research, *deposits itself in assertions*. The interest in researching logic is thus directed at *theoretical thinking*; a determinate kind of thinking is preferred and at bottom the exclusive theme. Insofar as this deposits itself in assertions and stands in a peculiar connection with the meaning-like and the thought-experiences, the task arises of seeing this whole complex in its originary unity, in order to win the possibilities of researching these states of affairs in determinate respects. The crucial observation, for the lecture's argument, is that logic's interest is from the start narrowed to *theoretical* thinking deposited in assertions — the very λόγος ἀποφαντικός whose merely-one-among-many status §2 established. The privileging of the theoretical assertion, already a Greek temptation, here becomes the silent presupposition of the discipline.

Heidegger reports Husserl's then-current theory, taken over from Brentano and long since abandoned: meaning, over against the plurality of possible meaning-acts that can grasp it, is an *ideal unity*, a *species*, over against the concrete singulars (acts) — so that Husserl speaks of the ideal meaning as the genus for the singularities of the respective acts meaning this meaning. This theory played a great role in phenomenology's first years; the whole traditional conception of abstraction, brought near to Husserl through Brentano (who took it from scholasticism), yielded the necessity, if such ideal meanings were to be sought out, of the respective concrete *Vergegenwärtigung* of the *Erlebnisse* in which the meanings are there — the "subjective realization." This is the hinge by which logic drives toward consciousness: because ideal meanings are grasped only in concrete acts, one must make present the *Erlebnisse* in which meaning is given — so the investigation of logical objects necessarily turns to the field of lived experiences.

In the meaning-acts a distinction can be fixed: acts in which an *empty* understanding takes place, and acts in which such meaning-understanding develops into one oriented at the meant state of affairs itself, fulfilled by it. *Empty meaning* (*Leermeinen*) and *meaning-fulfillment* (*Bedeutungserfüllung*) are acts. For a proper understanding, and an orientation about where such acts are presentable, one needs an understanding of what is meant by "act." Acts are identical with the *intentional Erlebnis*. "Act" delimits a determinate genus within the total sphere of *Erlebnisse* designated as consciousness. Consciousness says nothing other than a *region* of determinate occurrences having the

character of *Erlebnisse*; in this regional sense the concept of consciousness must be understood, and Husserl held it fast thus up to the present. With the title "consciousness" a determinate object-category is delimited. The empty/fulfilled distinction is the LU's discovery of intentionality's fundamental structure (meaning that reaches toward, and meaning that reaches its object), and Heidegger fixes the *regional* sense of consciousness: consciousness is, in the first instance, a *region* of occurrences of the character "lived experience" — a sense he will later show to be ontologically undetermined.

All these objects have a quite characteristic way in which they are themselves graspable: one designates this access as *inner perception*. I am conscious of these *Erlebnisse*; the total region of *Erlebnisse* is what can become conscious to me in *immanent* perception. Consciousness in the sense of inner perception, as perceiving of the immanent, is immediately related to the first concept of consciousness as experience-region. Within this region there is a determinate class of *Erlebnisse* — acts, *Erlebnisse* that as such direct themselves *at* something; and usage today designates even a single act as *consciousness-of-something*. After the *Logische Untersuchungen* Husserl restricted the act-concept: there are intentional *Erlebnisse*, for example the so-called background-experiences, that are *not* acts; acts are those intentional *Erlebnisse* distinguished by the explicit *ego-cogito*. So the concepts of consciousness all stand in an inner connection: consciousness is the regional title for the total stock of psychic *Erlebnisse* that become accessible through consciousness in the sense of inner awareness, such that this inner awareness can meet a distinguished class of *Erlebnisse* characterized as consciousness-of-something. Heidegger has now laid out the three interlocked senses of consciousness in Husserl: the region of lived experiences; the access to that region (inner/immanent perception); and the distinguished class within it (intentional acts, marked by the *ego-cogito*). The reappearance of the *ego-cogito* as the mark of the act is quietly decisive — it is the Cartesian signature stamped on the very definition of the act, and the lecture will make it the lever of its critique.

For understanding what follows, Heidegger insists we hold the Greek direction as an orientation-standard. There the thematic field is beings as world and the being of life; this objective is interpreted such that in the explication itself determinate being-characters step forth — so that one can say: the Greek interpretation of being-there *stays within* being-there, and what it is, is this being-there itself in its becoming-explicit through the explication. Against this orientation at a determinate state of affairs, modern philosophy looks quite different: it has as theme consciousness in a quite determinate *purification*, so that evidently what initially comes into the field of vision needs a determinate reworking to satisfy the demands arising from this conception of philosophy. This is the structural contrast the whole chapter turns on. Greek interpretation remains *immanent to its matter* (being-in-the-world explicating

itself), whereas modern philosophy must *purify* its theme (consciousness) to meet a demand set in advance — the demand of rigorous, certain science — and that purification, not given with the matter, is where the deformation enters.

It makes the impression, Heidegger notes, that Husserl's distinctions are *verbal* — as has been objected; that is the primitive but dominant representation of what happens in the *Logische Untersuchungen*. Consciousness as region is characterized, first, by the access to it, inner perception, and second, by the fact that this region harbors that determinate experience-class, the acts, which are quite fundamental for the structure of consciousness. This region of consciousness is the theme of phenomenological consideration, and indeed with the aim of an *epistemological-critical clarification* (*erkenntniskritische Klärung*): the basic components of logic are to be brought to such clarity that they form a secured foundation for all further building of knowledge. The clarification of the basic phenomena of logic, carried out through their being-built-into the region of consciousness, has the character of epistemological-critical clarification. He defends Husserl against the "merely verbal" charge — the distinctions track real structures — while naming the *governing aim* that will prove decisive: the clarification is *erkenntniskritisch*, aimed at securing a foundation for knowledge, which is the care for known knowledge already at work in the choice of the whole undertaking.

§ 6. The care for known knowledge in which consciousness stands

a) The care and its possibilities of disclosing, retaining, and developing what it takes care of; its devoting-itself-to and losing-itself-in the cared-for

After this first provisional acquaintance with phenomenology's theme in its breakthrough, Heidegger poses two questions: what kind of being, determined by which being-characters, is this region "consciousness"; and how does it come about that just this region with these being-characters procures for itself a priority such that it becomes the theme of a science that later calls itself the fundamental science of philosophy? He then states the method. The determination of the being-characters of a being becomes possible through the interpretation of the *Sorge*, the care, in which such a being stands. As more than a guiding thread: the interpretation has the manner of being-cared-about-something as its theme; with the interpretation of the being-cared-about-something, this "something" itself becomes visible as the specific *about-which* of the care, that about which the care goes. It reveals itself in the way it is "there" in the care; from this being-present it becomes evident what possible being it has as encountering in and for this care. This is the methodological heart of the whole Husserl- and Descartes-critique, and it must be read against the third guard. *Sorge* here is a *methodological-diagnostic* category: to determine the being of a being (here, "consciousness"), one interprets the care in which it is held, because a care *discloses* its object in a determinate way and so determines how that object can show itself. This

is not yet the existential *Sorge* of *Sein und Zeit*, but its near ancestor — a structure of disclosure.

Heidegger stresses that care is nothing subjective and does not obstruct what it takes care of; rather it lets it come to its proper being. When a being is interrogated relative to the care disclosing it, it is not the manner of being-grasped that is to be researched, but precisely the *how* of the released encountering-from-itself of the being. The task is, for this determinate being called consciousness, first to bring to knowledge the care in which it stands; such an interpretation includes seeing the possibility of the specific care in its being itself. As a guiding thread regarding the being-character of care: as caring, it *first discloses* what it cares about; in its specific being it *retains* the disclosed being as such in a specific way; what is disclosed and so retained is *developed*, explicated by it — and this explicating is no theoretical philosophy about it, for every care has its peculiar way of developing the disclosed. The developed becomes for the care that to which it *devotes itself* (*sich verschreibt*); this devotion lies in the sense of being-cared-about-something, and ultimately what the care devotes itself to becomes something *in which the care loses itself*. The five moments — disclosing, retaining, developing, devoting-itself, losing-itself — are the analytic grid for everything that follows: a care opens a field, holds it, works it up, binds itself to the result, and finally disappears into it. The last two moments (devotion and self-loss) already carry the negative valence that the diagnosis of Husserl and Descartes will exploit: the care for certainty binds itself to its constructed field and loses itself there, missing the matter.

b) The care for known knowledge

The task, then, is to interpret this determinate being, consciousness, in the determinate kind of its presence and the corresponding tendency of a working-on, upon the care in which it itself stands; and this includes first characterizing this care roughly, out of the concrete states of affairs. For this it is necessary to ask: how is the theme "consciousness" there for contemporary philosophy? Seen from outside, phenomenology has its object-field in common with the philosophical discipline called psychology; Husserl himself characterized phenomenology, in the introduction to the *Logische Untersuchungen*, as *descriptive psychology*. Insofar as consciousness is theme for him in the sense that an epistemological-critical clarification matters, phenomenology's work stands in the same tendency as the then-dominant epistemology; and insofar as Husserl stresses that the theme of his investigations is pre-given in the *Faktum* of the sciences, in particular the mathematical natural sciences, exactly the same problem-tendency is present as with the "Marburgers" (the neo-Kantians, Cohen and Natorp). Heidegger thus situates Husserl squarely within the epistemological project of his time — descriptive psychology plus the neo-Kantian orientation to the fact of mathematical science — precisely in order to show that the

care animating that project is what Husserl shares with his opponents, beneath their disputes.

Within these two traditional traits, the psychological and the science-theoretical, alive in the *Logische Untersuchungen* in a special way, the originary shows itself: that in working on consciousness in the direction of epistemological-critical clarification it matters above all to bring what is to be worked on *into view as it is in itself*. It comes down to the wholly originary: the *raising of the phenomenal states of affairs*, whereas the previous philosophy was on the one hand burdened with natural-scientific categories, and on the other leaned its epistemology on Kant and was not free enough toward the matter itself to detach it from the Kantian way of posing questions. Heidegger again credits the genuine impulse — the raising of the phenomena themselves, free of borrowed categories and of Kantian framing — so that his critique remains a holding of Husserl to his own breakthrough.

The question now: which care motivates the development of consciousness as theme, and indeed in the specific working-tendency of epistemological-critical clarification? Heidegger makes present the connection in which the thematic stock "consciousness" gets fixed. The gaze rests on *cognitions*, specifically scientific cognitions, which in a stressed sense are designated as consciousness-of-something: meaning-experiences, therein the meanings of the assertions of theoretical thinking. From here we also understand the priority the title "consciousness" gains over all other *Erlebnisse* — for in itself it is a monstrosity to designate *love* as consciousness-of-something. The care stands, in the development of the thematic field, *at theoretical knowing* as it factually is as *science*; at science insofar as it occurs as a possible achievement-connection in culture and is claimed as the foundation of a culture grounded on science. This is a sharp and revealing stroke. The priority of "consciousness" is exposed as an artifact of the care's fixation on *theoretical scientific cognition*: only because the gaze rests on knowing does "consciousness-of-something" become the master-category — and the absurdity of calling love "consciousness-of-something" shows that the whole field has been cut to the measure of theory, not of life. The care is oriented to science as the cultural foundation, so its stake is the securing of culture through secured knowledge.

The working-tendency of consciousness as epistemological-critical clarification makes the care still clearer. Into what respect is theoretical knowing placed? Into the respect of *knowing*. The care goes to *known knowledge*, because knowledge is to take over the *securing* of being-there and of culture. This care for known knowledge wants, in phenomenological research, to come onto a matter-ground from which the groundability of all knowing and of cultural being can become a genuine one. Even this peculiar expressedness of the care for known knowledge, which formally says "it goes to the matter itself," even this care for the matter goes in a quite determinate tendency.

Heidegger flags that we will have occasion to face the maxim "to the things themselves," because behind it the most narrow-minded dogmatism can hide. By these more formal indications the care is for now only fixed as care for known knowledge, led back to a substantive ground on which the securing-work is founded. This is the central diagnosis. The care for known knowledge is the concern that knowing be *secured* and so able to ground culture — and Heidegger issues the sharpest warning of the chapter: the very maxim of phenomenology, "to the things themselves," can mask the most narrow dogmatism, because the care for securing decides *in advance* what the "things" are allowed to be. The immanent critique thus turns on showing that Husserl's own maxim is betrayed by the care that governs its execution.

He must show that this care is in fact alive. Rather than going through Husserl's work in detail, Heidegger proposes to hear that work where it speaks of itself — where it expresses itself critically against contemporary philosophy. Every right critique that stands in the matter itself shows, by the manner of what it defends against, what it is concerned with. This sets up §§7–14: the care for known knowledge will be exhibited not by exegesis of Husserl's positive doctrine but through his *polemics* in "Philosophy as Rigorous Science," on the principle that a thinker's critique betrays, in what it attacks, what it most cares to secure.

§ 7. Husserl's confrontation with contemporary philosophy in the treatise "Philosophy as Rigorous Science" and the care for known knowledge alive in it. The general aim of this treatise

Such a confrontation with contemporary philosophy stands at our disposal in Husserl's "Philosophy as Rigorous Science," which lies ten years after the *Logische Untersuchungen*. In the interim phenomenological research had been further clarified, so that it could be systematically formed and placed into the work of philosophy. We will have to see whether what we determined as the specific care characterizing the marking-off of the consciousness-field really comes to expression; the consideration will open a further horizon of the matters. Heidegger thus uses the *programmatic* text of 1911 as the place where the care for known knowledge, latent in the *Logische Untersuchungen*, should become explicit.

For the development of what stands in the care, the *possibilities of taking-care* can serve as a guide. He recalls them, sharpened to five: a determinate care has the peculiarity of disclosing what it goes about and bringing it into being-there; of explicating the disclosed concretely as it is there; of retaining the explicitly developed in a determinate way; of *devoting itself* to the retained — that is, making determinate principles drawn from it normative for the cared-for of *other* cares; and of *losing itself* — positing what stands in the care so unconditionally that from it every care is in principle

motivated. When a care is itself explicated according to these respects, an access is also opened to what we designate as the specific *Unruhe*, the restlessness, of a care. The addition of "restlessness" is significant: a care is not a static attitude but a disquiet that drives, and the fourth and fifth moments now carry an explicit imperialism — the care for known knowledge will make its own principles normative for *all* other cares and posit its object so unconditionally that everything else is motivated from it. That over-reach is what Heidegger means to expose.

If we grasp phenomenology in its concrete breakthrough in Husserl, then in the context of this seemingly critical consideration we gain insight into substantive findings of a thoroughly *positive* nature. He gives the result of the interpretation in advance: the concrete care leading to develop consciousness as a thematic field, to retain it, and in principle to posit it as a further theme of philosophy, is *care for known knowledge* — such that the knowing of knowing becomes exhibited and exhibitable *from a finally secured ground*. On the basis of Husserl's treatise it will be shown that for the peculiar role consciousness plays, a concrete care for known knowledge is the general motive. The thesis is now fully explicit: the elevation of consciousness to the fundamental theme is motivated by the demand that knowing be grounded on an *absolutely secured* base — the demand for an *Archimedean point*, which the lecture will trace back to Descartes' *fundamentum inconcussum*.

He characterizes the general aim of the treatise. As the title says, the intention is not to sketch a program but to sharpen consciousness *for the idea of a philosophy as rigorous science*. The treatise rests on the conviction that even the *idea* of such a philosophy has been lost, so that it is set the task of bringing this idea itself to light and then lending it the right impetus by presenting concrete pieces of such investigations and their methodology. This task is carried out not in a thematic presentation but on the path of a *critique*, oriented in one respect at a *falsification* of the idea of philosophy as such, and in another at a *weakening* of this idea. This conception is suggested by a historical distinction: in the modern period from Descartes through Kant and partly in Fichte a determinate idea of scientific philosophy is alive; immediately thereafter, in Romanticism, this idea underwent a weakening — though it must be noted that Hegel had exactly the same hope as Husserl, finally to make philosophy a scientific one, that for him as for Husserl it matters to make philosophy *teachable*. Husserl makes Romantic philosophy responsible for a reaction one can designate as, first, naturalism, and second, historicism. Heidegger lets the alignment of Husserl with the whole rationalist line (Descartes–Kant–Fichte–Hegel) stand: what unites them is the will to a *teachable*, objectively communicable science — which is exactly the form taken by the care for known knowledge, and which makes Husserl, despite his anti-historicism, an heir of Descartes.

From these two tendencies, insofar as they venture to break into philosophy's field of work, a double ruin results for philosophy as rigorous science. Formally, the standard guiding the idea is whether philosophy has come so far that it can present an *objectively communicable doctrinal content binding for all times*; so far as it cannot, it is no rigorous science. (Heidegger adds the editorial-historical note that Husserl now stands much more positively to both Fichte and Hegel and would no longer write the sentences against speculative idealism.) The criterion makes the care fully visible: "rigorous science" means a doctrine *binding for all times and communicable to all* — timeless, anonymous, teachable validity — which is precisely the ideal of absolute certainty severed from the concrete, historical being-there of the one who knows.

Heidegger then sets the weight of the consideration on the question that occupies us: we want to come clear about the being-character of consciousness, which is the theme of philosophy. That the named care is alive in the development of the thematic field "consciousness" is to be shown first. The attention is to be directed at the critique, asking: how does the critique look — against what is it directed, and how is it carried out; what motives has this concrete critique — why do just naturalism and historicism become the theme of critical consideration, and why in the characterized manner, to be called "clarification of the problems"; how, from these motives, does what the critique really comes down to become visible, namely the care alive in the development of the critique with regard to its means; how far does the treatise expressly bring this specific care to relief; and finally, how, from the care so exhibited, is consciousness determined with regard to its being-character. At the same time we will see the *limit* of the consideration: in the exclusive restriction to Husserl's treatise we are *not* in a position to make recognizable why it came about at all that consciousness became the theme of philosophy. This list both organizes §§8–16 and flags the necessity of Part Two: "Philosophy as Rigorous Science" can display the care for known knowledge at work, but cannot explain the *origin* of consciousness as theme — for that, the regress behind Husserl to Descartes (and Thomas) is required. The limit announced here is the structural justification of the whole second Part.

§ 8. Husserl's critique of naturalism

a) Naturalization of consciousness

How does the critique look, and against what is it directed? Against naturalism and historicism. We must make clear how the expression "naturalism" arises at all and what stands in the field of vision when something is designated as naturalism. Naturalism *coincides with the discovery of nature*; analogously, historicism grew from a discovery of history. The discovery of nature is the discovery of nature as the object of a distinguished science, mathematical natural science, and this discovery has naturalism as its consequence. That says: the being- and object-kind of the *natural connection*

becomes the content-guide for grasping every kind of being and objectivity; accordingly, normative for every being-domain and its cognitive determination is the specific *rigor* of mathematical natural science. Heidegger isolates the essence of naturalism as a *transfer*: the mode of being proper to nature (the object of mathematical physics) is made the universal measure of being as such, and its rigor the universal norm of knowing. This is the same structure as the predominance of the idea of science diagnosed in §3 — an idea of one region's objectivity universalized in advance — and it is what Husserl rightly attacks.

The question is now in how far such a *widening* of a determinate science- and object-idea has taken place in the direction of philosophy's thematic field — in what sense the objective field of philosophy and its method are placed under the idea of mathematical natural science. With this question Heidegger turns Husserl's own critique of naturalism into the lever of his deeper critique: for he will argue that Husserl, while rejecting the naturalizing of consciousness, *himself* leaves consciousness under the sway of an idea of rigorous science modeled on mathematics — so that the critique of naturalism does not reach far enough back, stopping short of the care for certainty that naturalism and Husserl's own phenomenology share.

He first specifies the basic character of mathematical natural science. Apart from its rigor, it is distinguished in that its results are *formulable in laws*; a lawfulness scientific in the eminent sense is "universally binding." The bindingness of these propositions is so prevailing and at the same time so imposing in human being-there that it constitutes the proper motive leading to *absolutize* the idea of this science. Nature is for philosophy not something foreign, because philosophy had from of old aimed at a lawfulness that could be formulated as norm-giving; so it is no accident that a science risen to such rigor as natural science seizes this task, that the specific objects of philosophy *fall prey* to natural science. Heidegger thus locates the temptation: the very thing philosophy always sought — binding, norm-like lawfulness — natural science now delivers with imposing rigor, so philosophy lets its own objects be taken over. The first effect of the naturalizing of philosophy is the *naturalizing of consciousness*; and Heidegger inserts the decisive genealogical note: "this putting-together of the idea and of consciousness points back to Descartes." The pairing of an absolutized idea of rigorous knowledge with consciousness as its field is itself Cartesian, which is why the regress of Part Two will be required.

How does it come to the naturalizing precisely of consciousness? The task arises of winning the legal grounds for consciousness's addressing and exhibiting an object as really existing; for this grounding of the legitimacy of the positings and acts of consciousness a study of these connections themselves is needed — a *critique of knowing*. The psychic being, seen as nature, gets determined in the sense of

natural-scientific categories; the unified organization of this misunderstanding is what one can call experimental psychology, insofar as it raises the claim to fundamental significance. (Heidegger notes Husserl never meant to say anything against experimental psychology as such.) The ideal laws are reinterpreted into lawfulnesses of pure consciousness-courses — not only in the domain of thinking but also of willing-action: the norms valid here too are reinterpreted into psychological process-laws. Husserl stresses that the exemplary index of all ideality is the formal-logical laws. The naturalizing of consciousness thus means: the *ideal validity* of laws (logical, axiological, practical) is reinterpreted as the *factual regularity* of mental processes — the very confusion (psychologism) the *Logische Untersuchungen* had refuted, now diagnosed as a species of naturalism.

b) Naturalization of the ideas

Beside the naturalizing of consciousness lies a further falsification of the idea of philosophy as rigorous science in the *naturalizing of the ideas*. By way of explaining "idea": the concrete investigations of the *Logische Untersuchungen* occupy themselves with meanings, seen as ideal unities over against the manifold of the acts carrying them out in meaning; this unity of sense is an ideal unity of *validity*, and on its ground arise quite determinate lawfulnesses of their own kind. This specific lawfulness of sense is reinterpreted by the philosophy that sees everything as natural science into a *lawfulness of the natural course of the thought-process* — the norm- and idea-lawfulness reinterpreted into a lawfulness of the thinking-course. The idea, idea-lawfulness, is *not seen at all*. The critique alive in natural science is one carried out *within* natural-scientific cognitive achievement, in the line of sight upon the matters; as natural-scientific critique it is directed at the matters themselves. It is absurd, Husserl says, that the critical possibilities of a single science should have the possibility of critically investigating this science purely *as science* — for a fundamental *change of object* has taken place. The misrecognition of this level was the occasion for natural science to claim the solution of epistemological problems for itself, thereby blocking the way to bring the specific objectivity "consciousness" as such into view and from there to clarify the problematic that knowing and acting pose as their own being. The point doubles Husserl's *Prolegomena* argument: a science cannot ground itself by its own first-order means, because grounding requires shifting to a different object (the cognition of that science) — and naturalism's failure to see this "change of object" is what let it usurp epistemology and bury the field of consciousness.

Heidegger sums up: naturalism is, first, naturalism of the ideas, second, naturalism of consciousness. The ideal connection of ideal laws, seen upon the comportments of life, can be designated as norm-lawfulnesses, to which the disciplines of theoretics, axiology, and practics correspond; the ultimate stocks in which these norm-lawfulnesses

are grounded are the *ideas*. It is characteristic of naturalism that it does not see the ideas — it is *idea-blind* (*ideenblind*). Consciousness is the proper theme of the critique, consciousness as theme of epistemological working-on. The question stands whether the natural-scientific method, even widened in principle, has the possibility so much as to *understand*, let alone to *ground*, the legitimacy of the consciousness-positings.

"Idea-blindness" names naturalism's core defect — its incapacity to see ideal validity as such — and Heidegger lets the question stand pointedly: a widened natural-scientific method cannot even understand, much less ground, the legitimacy of consciousness's positings, which is exactly why a non-natural-scientific method (essence-intuition) will be demanded.

c) The being of nature as horizon for experimental psychology

How does the critique seek to prove naturalism a falsification of the drive to strictly scientific philosophy? The guiding thread: if it turns out that natural science, with its own means of object-positing and working, cannot reach philosophy's problem-field at all, then every philosophy that in any way makes use of this natural-scientific method is thereby condemned. Experimental psychology is nothing other than a scientific discipline that, in its manner of object-positing and idea of lawfulness, takes over the method of natural science. A fourfold task results: to characterize the specific scientificity of mathematical natural science; to characterize the scientific tendency of experimental psychology; to exhibit the problem-domain of philosophy; and to characterize the discipline adequate to that problem-domain (scientificity being characterized with regard to the appropriate seeing of the object-kind and then the manner of treatment motivated therein). The strategy is clean: show that nature and consciousness are *different kinds of being*, hence demand different methods, so that any psychology modeling itself on physics necessarily misses consciousness.

The object of natural science is nature as physical nature, the unity of a quite determinate thing-being. As basic character of this being is given that every thing in the being-sphere is perceivable as *identically the same* in a multiplicity of different direct perceptions, and that this identifiable selfsameness is perceivable by a *plurality of subjects* — this thing-being is intersubjectively identifiable as so-being. All this being has, in temporal and spatial extension, its determinate properties and stands in a total connection of *causal* series: every thing-property is nothing other than a causal-lawful possibility of determinately regulated changes of this thing in the connection of all-nature, so that in principle every thing is determinable by regress to the *functional connection* of thing-relations; and this thing-unity *presents itself in appearances*, *Erscheinungen*. This peculiar being of nature is the *unspoken horizon* into which psychology now takes the states of affairs it unclearly and arbitrarily takes up from tradition: phantasy, perception, representation. These basic phenomena do not

themselves become the theme of psychology; rather, in connection with them, the states of affairs are so worked that determinate regulations and lawfulnesses are established — and these laws too carry in themselves the basic concepts they started from, but in the same unintelligibility and undifferentiatedness. This basic defect of psychology is grounded in the predominance of the natural-scientific consideration, which aims at regulations of the courses and *overleaps the appearing thing*, overlooking that its specific domain is not one like that of natural science. The diagnosis is exact: experimental psychology silently imports the being of *nature* (identical, intersubjective, causal, presenting-itself-in-appearances) as the horizon for phenomena that are not nature at all, takes its basic concepts (perception, phantasy) over from tradition without examining them, and so produces laws resting on un-clarified concepts. Heidegger adds that Husserl's objections tell less today, since phenomenological work has penetrated psychology — but only as a borrowing of results and terms, not a genuine purification of the science from its foundations.

d) The peculiar being of consciousness as the true object of philosophy and the method of essence-intuition for winning universally binding propositions

Consciousness has, against the being of nature, the peculiarity that in it there is *nothing like an identical held through a manifold of direct experiences*; that is in principle excluded from the being-domain of the psychic. Every perceivable *Erlebnis* is in principle, in the moment it is to be perceived again, *no longer the same*; and this non-identifiability of a being of the character of consciousness goes so far that it holds even for the *same* subject — whereas the things of nature have intersubjective identifiability. This is the concrete basis for the psychic being called *stream* and *flux* — no trivial, popular title, but grounded in the peculiar being-mode of the psychic itself. This psychic being does not *present itself through appearances*; rather it itself, as it appears, *is* the object. The object of philosophy is never nature but always *phenomenon*. (Heidegger remarks, with interest, that in the *Logische Untersuchungen*, where Husserl researches concretely-phenomenologically, he positively *rejects* the use of the word "phenomenon.") This peculiar being "consciousness" is a *monadic unity*, constituted by lying in a temporality that has a doubly infinite horizon: every being of this domain is traceable into an infinite past and likewise into a futurity that has no end. Two things are decisive here for the lecture's argument. First, the contrast nature/consciousness is drawn in terms of *identifiability through appearances* versus *self-givenness without appearances* — consciousness does not appear, it *is* as it appears — which is the correct phenomenological insight (and recalls the φαινόμενον won from Aristotle). Second, consciousness is characterized by *temporality* with a doubly infinite horizon (infinite past and future); Heidegger notes this approvingly but will object that this temporality is left as an endless horizon of the flux, not grasped as the finite temporality of *Dasein* — the very deficiency Part Three will press.

Which method must correspond to the being of consciousness so that the working-on of consciousness yields a discipline leading to universal and universally binding propositions and an absolute objectivity? Since this being is a being-domain that is not nature but phenomenon, the method too cannot be that of natural-scientific interrogation; and since it is not nature but has something like an *essence*, the only method leading to fixed results is that of *essence-intuition*, *Wesenserschauung*. This method, and it alone, suffices a consideration of consciousness that comes to something other than natural-scientific regulation, and whose establishing has the task of seeing the ideal connections as ideal and bringing what it has seen into binding propositions of science. Heidegger has now reconstructed Husserl's positive result: because consciousness is phenomenon and essence, not nature, its science must be *eidetic* (essence-intuition) rather than inductive — and the *telos* of the method is stated in Husserl's own terms, "binding propositions," "absolute objectivity." That *telos* is exactly the care for known knowledge, and naming it as the governing aim of essence-intuition sets up §9's claim that Husserl's whole method is the absolutizing of a securing-tendency.

§ 9. Clarification of the problems as purification and radicalization of their tendency. The care for securing and grounding an absolute scientificity

Heidegger asks, over against this critical consideration: wherein is this critique — the way it chooses and runs through its object — motivated, and how are we to characterize the critical method itself? Husserl speaks of the method as a *clarification of the problems*, *Klärung der Probleme*. The critique speaks against a naturalization in order to win a proper science of consciousness; but insofar as this clarification is *critique*, precisely the intention and idea of a *scientific* working-on of consciousness is itself *absolutized*. The decision is thus at the same time a principled decision *for* the matter concerned. In the course of this critique it comes down to winning the possibility of a strict lawfulness — one strictly objective, binding, and exhibitable. The drive toward the peculiar *purification* of the field "consciousness" of every facticity, which is the basis of philosophy as rigorous science — this drive to universal bindingness is now the already-characterized *care for known knowledge*. This is the chapter's pivotal claim. By framing his critique as a "clarification of problems," Husserl does not step outside the scientific tendency but *absolutizes* it: in rejecting naturalism he decides all the more firmly for an absolute, fact-free, universally binding science of consciousness — so the care for known knowledge governs the very form of the critique.

Heidegger restates the contrast of being-modes: for a subject an *Erlebnis* is never repeatable as the same; the proper being-connection of the psychic is a course of *Erlebnisse* regulated by a determinate temporality with a doubly infinite horizon. As to identifiability, one might say the psychic is intersubjectively identifiable insofar as a

psychic being is unambiguously *understood* by a plurality of subjects; but this must not be equated with the intersubjective identifiability of the nature-thing. Psychology grasps the psychic being, as to its being-mode, as *co-being with nature*, grounded in nature-being; every lawfulness is one of the factual, and natural science has to do with facticities. The question then is whether there is such a thing as the possibility of making *facticity as such* intelligible *through facts*. The buried question is sharp: psychology treats the psychic as a fact grounded in nature and seeks factual laws of it, but facticity itself cannot be grounded by more facts — a regress that points beyond naturalism to the question of the *being* of the factual, which natural science cannot pose.

What interests us, Heidegger says, is not the stance toward the being of nature and of the psychic, but the question which *tendencies* are alive in the critique of naturalism, by which *care* the choice of object and the critique are led. He claims: the care from which the object-choice for the critique grows is the *care for known knowledge* — the care for *securing* knowledge on the path of the *knowing of knowledge*, the securing and grounding of an absolute scientificity. Naturalism is put under critique because its problematic and method aim, through an exact scientific working-on of consciousness, to place norm-lawfulness on a *scientifically secured ground*. The critique proceeds in the manner of *clarification of the problems*: problems are taken up, and thereby a determinate decision for the asked and the asking-tendency is joined in — in the sense of a *radicalization* of the tendency alive in what is taken up. It matters to Husserl to bring the scientific tendency toward natural science *radically to its end*. With the taking-up of critique as a clarification of problems, the critique has *decided for the scientific tendency of naturalism*; it proceeds in a *purification* such that all moments are thrown out that could endanger the winning of an *absolute evidence and certainty*. This purification of the tendency is its *absolutization*. This is the decisive result of the chapter and one of the lecture's central theses about Husserl. Husserl and naturalism share one and the same care — the care for an absolutely secured, universally binding science — and differ only over the object and the means; Husserl's "clarification of problems" is the *radicalization to the end* of the very scientific drive naturalism embodies, a purification of consciousness from all facticity precisely in order to secure absolute evidence. The critique of naturalism therefore does *not* reach the root, because that root, the care for certainty, is what Husserl most shares with what he criticizes.

Heidegger then lays out four things to see in what follows: first, to make present what "clarification of the problems" means, and from there how the purification of the problematic and methodology of naturalistic philosophy looks, and how in every step the care for absolute scientificity is alive; second, how the *ordering* of the problems is positively taken over from naturalism, and how therein again lies the determinate inclination toward it and its method; third, how at the center stands the problem of *knowing*, and indeed the problem of the cognition of physical *nature*, so that this

problem-connection furnishes the horizon for the theme "consciousness"; and fourth, how, in the reference to certain tendencies in history, these are drawn in as positive. The program announces that the analysis of Husserl's "clarification of problems" (§§10–12) will expose at the center the *cognition of nature* as the secret horizon of the whole theory of consciousness — the deepest proof that the care for known knowledge, modeled on the knowledge of nature, governs Husserl's phenomenology from within.

§ 10. Clarification of the problems

a) The question and its structures

Ad the first point: what is a problem, and what possibilities lie further in a clarification of problems? With the closer interpretation of the phenomenon-connection "problem," Heidegger says, we run into phenomena that will later occupy us at a more fundamental level. "Problem" is best rendered as *Vorwurf* — that which is projected or thrown-before (also, in German, "reproach"/"task"). One usually identifies "problem" with "question," but a problem is a determinately formed and expressly posed question; so to clarify the structure of the "problem" we are led back to what a *question* is. The deflation of "problem" to "an explicitly posed and task-laden question" prepares the polemical thesis to come — that the inherited "problems" of philosophy are not neutral starting points but sedimented decisions.

In a question Heidegger distinguishes: the *Befragte*, the interrogated (that which is asked about); the *Gefragte*, the asked-for (what is sought); the *respect* in which it is asked, the *whereupon* the interrogated is interrogated, what is asked of it; and the *Wie* of the asking itself, the proper claim of the answer. He then lists, as a program, further moments: how question and problem connect; how a question *is* — whether questions lie around like stones on the path (the being of "question"); the modifications of the moments; the proof that with a question a determinate *method* is co-decided in advance; the connection between problem and *problem-history*; and the decisive analysis of the question as a *seeking*. The question is a determinate seeking, and "question" is no theoretical phenomenon at all; seeking is a determinate *Sorge* of *Dasein*, and the *Sorge* is itself a being-possibility of *Dasein* — only from here can it be decided what it means to decide for a "problem." This list is more than a checklist: it routes the analysis of the question down to *care* and to *Dasein*, asserting that questioning is not a theoretical operation but an existential comportment, a seeking grounded in care — which is why a "problem" is never neutral.

He illustrates with "Does an external world exist?" The *Befragte* is the external world; through the question it is taken into a respect — whether the external world has reality — so the *Gefragte* is not the external world but the *real-being* of the external world, and the *Fragehinsicht* is reality. As a rule the *Befragte* is not closely looked at; it is there as

theme but not in an expressly appropriating gaze. The degree to which the *Fragehinsicht* is developed and clearly available determines the possibility of marking off the characteristic moments at the *Befragte* itself — and here lies the same deception-possibility met in language: the developed *Fragehinsicht* allows a question, though it gives itself out as a question, nonetheless to be *stamped into a dogmatic opinion* (when, for instance, the concept of "reality" is fixed in advance). This carries the §2 analysis of covering into the theory of questioning: a question with a prefixed respect (a prefixed concept of "reality") only *looks* like an open question while in fact dictating its answer — a dogmatism masked as inquiry, exactly the danger Heidegger will press against the "problems" of the tradition.

The proper questioning, as a being-out-for a question-decision, determines itself from the proper *answer-tendency* — from how the answer is meant, striven for, claimed. Two characteristic possibilities: first, the answer-tendency can go to the winning of answers in the sense of *valid propositions*, the answer striven for as a proposition that enriches the treasure of valid truths and can be built in as a "result" into a domain of objective validity-unities — all scientific propositions, insofar as one grasps science as a system of objective propositions, are truths in this sense, with the ultimate tendency toward an ideal connection of all valid propositions. Second, and fundamentally other: the answering can be out to bring the *being of the questioner* into a determinate basic relation to the interrogated being — not to multiply an identical stock of propositions but to bring the questioner's being to a being and matter-domain, possibly just because there is an inner *dangerousness* of being pushed away from such a being. Here the interrogated being may turn out to be, by its own being-sense, *itself questionable*, demanding by its specific being to be interrogated, so that answering and questioning mean nothing but exhibiting being-determinations of the being — wherein the *questioning being (Dasein) fundamentally co-determines the being of the interrogated*, and conversely. In this proper sense the answer *disappears*, does not come to itself (against the first case, where it deposits itself in "objective structures"); the answer is answer precisely when it understands how to disappear in the right way, freeing the way to the being, so that it remains *with* the questioning. The answer strikes back into questioning, and in this striking-back into ever-new questioning is constituted what Heidegger calls *Fraglichkeit*, questionability. This is one of the most important methodological passages of the lecture and the clearest statement of how Heidegger's own questioning differs from Husserl's science. Two answer-tendencies are opposed: the scientific, which adds propositions to an objective stock; and the ontological-existential, in which the questioner's own being is brought into relation with a matter that is itself questionable, the answer *disappearing* back into questioning and constituting *questionability*. The question of being is of the second kind — which is why

it cannot be a "problem" in the first sense, a result to be filed, but a questioning in which *Dasein* and the being it asks after co-determine each other.

b) The problem and the moments of its being: clarification of the problem as co-deciding for the interrogated, the asked-for, the question-respect, and the answer-tendency

How does the problem stand to the question? A problem is a *posed* question — one expressly held needful and worthy of answer, an expressly task-like posed question; the *task-character* distinguishes a problem from an arbitrary question, and indeed the *task-character for researching cognition*. Just because in the problem the task is expressly grasped, it matters all the more to go *further* in answering; in a problem-statement there is even less time to investigate the *Befragte* in itself — it characteristically gives itself as something within which everything further is already supplied. In this peculiar being-character of the problem lies the necessity of a covering of the *Befragte* grounded in the problem-statement itself. Heidegger draws a sharp consequence: every publicly known and discussed problem is not so much the sign of thoroughness as a *prejudice of the most dangerous kind*, insofar as problems as such are suited to *cover the matters* — the problem is geared toward the answer and depends on what is asked for; in the problem the *Befragte* is interrogated only in the *Fragehinsicht* taken up with the problem and as the *traditionally* taken-up interrogated. This is the polemical heart of §10. A "problem," precisely because it packages a question as a ready task, *covers* the matter it is about: it fixes in advance what is asked, in what respect, and along which inherited lines, so that the public currency of a "problem" is a danger, not a credential — a prejudice masquerading as rigor.

Problems are mostly there not as express questions but as *question-words*, *Frageworte*, that direct an understanding coming toward the words into determinate directions of questioning; the words carry the question-statement traditionally with them. These problem-words and this peculiar being-there of problems can be objectified in historical consideration: one speaks of a "problem-history," of "problem-situations," "dominant problem-interests" (Heidegger names Windelband and Nicolai Hartmann, and credits the Marburg School with awakening, within the possibilities of the time, a sense for a living consideration of history that called itself problem-history). For such a consideration there is, as it were, a determinate *stock* of problems, found in Plato, Kant, and so on. But — and this is the decisive consequence — there are problems *only for standpoints*, for only then is a *Fragehinsicht* held fast and dictated; problem-history exists only on the ground of an express philosophical *standpoint*, whereas a truly standpoint-free research knows only "*matters*" as possible sources and motives of questioning and of the formation of question-respects. A last moment: in every problem its *method* is co-given, something being settled about a delimited interrogated with determinate concepts. Heidegger thus turns "problem-history" against itself: to read the

past as a sequence of problems is already to impose a standpoint (a fixed *Fragehinsicht*), so that genuine, matter-led research must dissolve the inherited "problems" back into the matters — which is precisely what the *Destruktion* will do, and what distinguishes it from neo-Kantian problem-history.

On the ground of these moments it is now not hard to come to an understanding of what *clarification of a problem* means: nothing other than, in the question and with it, to *co-grasp the interrogated and the asked-for as a task* — that is, to *co-decide* for the interrogated, the question-respect, and the answer-tendency. This holds also for the critical clarification of the problem-tendency of naturalism. The result fixes the charge against Husserl's method: to "clarify a problem" is to *co-decide* in advance for its interrogated, its respect, and its answer-tendency — so Husserl's clarification of naturalism's problems is not a neutral examination but a taking-over, with naturalism, of *what* is asked and *how*.

c) Husserl's clarification of the problem-tendency of naturalism through transcendental and eidetic purification of consciousness. Absolute validity and evidence

In clarifying the problems of naturalism, Husserl decides for the determinate object and at once for the manner of treatment as an exactly scientific one. The clarification consists in this: the co-positing consciousness is clarified, and with it the *Fragehinsicht* and the question-tendency — the manner of the exactly scientific interrogation-tendency of the clarified. It is a *purification* of the object and of the manner of treatment, and this purification, which is a *double* one, is to show us that in it the indicated care for known knowledge lives. In what sense is consciousness purified to become, as purified, the object of a phenomenology of consciousness? In psychology consciousness is so posited that physical being is co-positing with it; all these positings of consciousness as experience-connection are co-positings of nature. But for facts to be understood in their being-known, the sphere that is to *give* such knowing must not be of the same character; consciousness must be purified of every admixture of nature-positings — in it nothing like the consciousness of a *human* may be posited. This being-free from every nature-positing Husserl designates as "*transcendental*." That is the one purification of the object-field, in the sense of switching off every nature-positing; the consciousness-field is, as to its being, no facticity. Heidegger reconstructs the transcendental reduction precisely as a *purification*: consciousness is cleansed of every co-positing of nature (hence of the "human," the psychophysical), and this nature-free residue is what "transcendental" names — a procedure whose motive, he insists, is the securing of a field free of contingent facticity.

Yet it is not switched off that this being is an *individual*, singular one; the being of consciousness is, for all transcendental switching-off of nature, an individual singularity of the experience-stream. Is there a method of working on transcendently pure

consciousness such that the establishments arising in it have *intersubjective validity*? This demand is met by what Husserl designates as *essence-knowledge*; and here too the idea of essence-knowledge has grown out of a determinate critical delimitation from natural science. This purification is the so-called *eidetic* purification of consciousness. In this double purification-tendency, the transcendental and the eidetic, the care is now alive that such an object-field be secured as lets *absolute bindingnesses* be won. Through the transcendental reduction the *theme* is first won, with respect to which the question can arise: how is a science related to it possible — what kind of grasping must there be for a science to establish itself, what grasping suffices the idea of absolute grounding? Heidegger has now shown the two reductions as the two strokes of a single purifying care: the transcendental reduction secures a field free of contingent nature, the eidetic reduction secures *universally and necessarily valid* essence-truths about it — together yielding the "absolute bindingness" that is the goal of the care for known knowledge. Both are motivated, by his reading, not by the matter but by the demand for an absolutely grounded science.

Considering the development purely historically, Heidegger notes that in the *Logische Untersuchungen* there is as yet no talk of *Wesensschau*; the Second Investigation contains something like an abstraction-theory, a phenomenology of the grasping of the universal that investigates only the universality-consciousness in the sense of thing- and matter-experience — and nothing is in principle settled there about whether such species-grasping can without further ado be transferred to every object-field. This extension is then made by saying: only essence-grasping is the grasping-kind of transcendently pure consciousness in which propositions arise binding for all eternity. So it is to be seen out of which decision-motives the care springs to secure and maintain *absolute scientificity* with respect to transcendently pure consciousness; whether Husserl's claim to settle something about every consciousness, even God's, holds by right is still to be decided. The essential scientifically decisive thing in the scientific tendency is co-enacted by Husserl: the *purified* problem-statement is nonetheless *still naturalism*. This is the chapter's reiterated verdict, now sharpened: by universalizing the *Logische Untersuchungen*' local abstraction-theory into the thesis that only essence-intuition yields eternally binding truths, Husserl absolutizes the scientific tendency — so that the purified, transcendental-eidetic phenomenology, for all its anti-naturalism, *remains naturalism* in its deepest care, the care for an absolutely grounded science (the claim to legislate even for God's consciousness being its hyperbole).

Heidegger closes §10 with a methodological caution that protects his own critique. With the designation "transcendental" one must, in Husserl's work, distinguish between what it determines and fixes *terminologically* of itself, and what he actually *achieved* in real work. That one did not do this, and so completely misunderstood him, comes from

seeing the *Ideen* only in connection with contemporary philosophy; through such aspects one blocks the very possibility of seeing the decisive thing. The essential is that here something was *made*, the matter brought from the spot; the self-interpretation is irrelevant — for where something is really done, the doer mostly does not know what is at stake. This is a generous and important qualification. Heidegger's critique is aimed at Husserl's *self-interpretation* (the terminological framing of phenomenology as absolute eidetic science), not at his concrete achievement, which Heidegger reveres; and the maxim "where something is really done, the doer mostly does not know what is at stake" both excuses Husserl and licenses Heidegger's own procedure of reading Husserl *against* his self-understanding — the immanent critique (the sixth guard) at its most explicit.

§ 11. Ordering of the questioning and guiding thread for the explication of the structure of all experience-connections

a) Orientation at connections of disciplines; philosophy as norm- and value-science

A second moment making this care for known knowledge visible, tightly bound to the first (the idea of absolute validity and evidence), shows itself in the *ordering of the questioning*. The whole question-connection runs within a determinate frame oriented at *disciplines and connections of disciplines*: in place of natural science a new discipline is to be founded — without its being asked whether such a discipline has any sense at all. The positing of a discipline is again led by a discipline-interest, for the fundamental discipline of philosophy is to be won; the discipline stepping into natural science's place is to become the fundamental discipline of philosophy, which is itself there again as a *unity of disciplines*. The whole concept of philosophy is oriented at this unity of disciplines, for which, as norm-sciences, a basic discipline is won. Heidegger exposes a second symptom of the care for known knowledge: philosophy is conceived in advance as a *system of disciplines* needing a foundational discipline, so that the question is never whether "discipline" is the right form for philosophy at all — the disciplinary frame is taken over unexamined from the model of science.

In this connection a further traditional binding of phenomenology shows itself, also going to a strict scientificity: the conception of philosophy as a *norm- and value-science*. In the whole treatise nothing is said about the *object*; purely the idea of a *discipline* of it is carried through. The care for known knowledge shows itself in wanting to win a *new scientificity*; the interest in the matter itself does not come to language at all, except insofar as the matter is one that *admits* such treatment. The verdict is severe and consistent: "Philosophy as Rigorous Science" speaks throughout about the *form* (discipline, norm-science, scientificity) and never about the *matter*, and even where the matter appears it is admitted only so far as it tolerates the disciplinary-scientific form — the care for the secured form has wholly displaced the care for the thing.

b) Theoretical knowing as guiding thread

The third moment: the questioning of philosophy and of the whole critique has as its guiding thread not some fundamental structure of consciousness but the *experience-class of theoretical knowing* — and this as guiding thread for the explication of the structure of *all* experience-connections. The practical consciousness is always treated *analogically*: "the analogous holds also for valuing and acting." Theoretical knowing thus has the primacy — but not in the sense that one first asks what the originary phenomenon of theoretical knowing is; rather, without further ado, *mathematical cognition of nature* is made the prototype and basis. The so-called *Geisteswissenschaften* are always determined only by their *otherness* in contrast to the natural sciences; the idea of science is prefigured by the idea of *mathematics* as science — again a purely formal orientation at the moment of *validity* — and even the kind of norm-validity is seen from the sheer theoretical: "the exemplary index of all ideality are the formal-logical principles." So at these four characteristic moments it has shown itself that in this whole questioning the care for known knowledge is leading, problem-giving and problem-maintaining. This completes the demonstration begun in §9. The deepest stratum of the care is now exposed: not merely that theoretical knowing is privileged, but that *mathematical natural cognition* is silently made the *prototype of knowing as such*, the *Geisteswissenschaften* defined only privatively against it, and validity (the formal-logical) made the index of all ideality — so that the very gaze through which consciousness is studied is cut to the measure of mathematical science. The care for known knowledge governs not only the aim and the form but the *guiding thread* of the whole inquiry.

§ 12. Characteristic moments of the care for known knowledge in Husserl's critique of naturalism: reflected-shine, falling, building-ahead, entanglement, omission

Heidegger now asks how this care itself *looks* — which characteristic moments are to be claimed for this concrete care. The care for absolute bindingness, in the way it leads the critique and the positive work, shows a first moment, a phenomenon to be called *Rückschein*, reflected-shine. This peculiar phenomenon, as a character of the care, lies in this: that what stands in the care itself — the objective bindingness to be won — is alive in the concrete being of the care, such that everything coming into the care's field of vision is more closely determined *from this cared-for*. In the light of the care for known knowledge everything is seen that the care places into its task-connection; every question, every matter is taken up in advance in this determinate orientation. Husserl says literally: "Indeed the idea of science is all-encompassing; thought in ideal completion it is reason itself." This sentence, Heidegger remarks, is of a reach not at first wholly to be surveyed. The reflected-shine that falls from the cared-for onto everything the care deals with is a characteristic moment of the care insofar as the care

is so characterized that *it knows nothing of itself*. *Rückschein* is the first existential structure of the care: the goal (absolute bindingness, "science = reason itself") casts its light back over everything the care meets, so that nothing is encountered except as already colored by the care's aim — and the care is blind to this, knowing nothing of its own coloring power. Husserl's identification of the idea of science with reason itself is, for Heidegger, the extreme symptom: the care has absolutized its own object into the measure of reason as such.

In this caring there lies a peculiar *unexpressedness*: the care *falls prey*, *verfällt*, to what it takes care of. As such it has no time for any reflection on whether what it occupies itself with is in the end determined by itself; this unexpressed being-drawn-by-itself comes to expression in the character of the reflected-shine. What enters is what Heidegger calls *Verfallen an die Sorge*, falling to the care. *Verfallen* — falling — is named here, four years before *Sein und Zeit* §38, as the care's absorption in its object, its lack of time or inclination to ask whether its object is its own product. Yet this unexpressedness, which lets the care go up in itself, has nonetheless a specific *expressedness*: that of *Vorwegbauen*, building-ahead, a peculiar counter-shine given with the care itself. Insofar as the care goes up in the cared-for it is unexpressed, but it has a peculiar interpretation of itself in the form of a *programmatic systematics*: it procures itself a meaning, a sense, and an interpretation through the *program* it builds ahead for itself in a wholly formal way. Through this building-ahead the care gives itself a quite specific *rest* and the *security* of an objectively binding obligation; it needs a specific rest in order to give itself wholly to what it takes care of. And through this building-ahead the possibility of the reflected-shine is at once sharpened: the security with which everything is given in the sense of the program — the whole of history *violated* in this sense — rises with the development of the building-ahead, so far that the possibility of a concrete morality is made dependent on the existence of an *ethics as an absolutely binding science*. *Vorwegbauen* is the care's self-securing through a formal program (a system of disciplines, a projected complete science): the program gives the restless care its rest and the feeling of obligation, but it also intensifies the reflected-shine, forcing everything — even the whole of history — into the program's mold, to the point of the absurd consequence that there can be no concrete morality without first possessing ethics as a rigorous science.

Following these moments — reflected-shine, building-ahead, and this characteristic expressedness of the care — something originary shows itself underlying the whole phenomenal connection: a basic phenomenon belonging not only to the care but, as Heidegger says, to be learned much more closely bound up with the being-character of *Dasein* itself: *Verfängnis*, entanglement. The care, insofar as it goes up in the cared-for, is precisely thereby what it is by *entangling itself in itself*; through this self-entanglement the care comes to determine each and every thing from itself. *Verfängnis* is the deepest

of the structures and the one Heidegger most explicitly ties to *Dasein* as such: the care is what it is by catching itself in its own net, so that its self-absorption is self-determination — it determines everything from out of itself because it is entangled in itself.

This self-entanglement makes it that everything coming into the care's way is *taken care of*, such that what it does *not* take care of is not simply *not there*, but is taken care of as *something that ought not to be there*. Here Heidegger sees a further phenomenon, to be called *Versäumnis*, omission. Every care *qua* care *omits* something — and this is nothing brought to the care from outside: the omitted is precisely what the care itself *claims to take care of*. We must make this phenomenon concretely present and see what kind the omission of the care for known knowledge is — whether, *within* what it claims to take care of, it precisely omits something. By exhibiting a determinate omission as the omission of *this* determinate care, we win a new confirmation of the care-character of this care itself. This is the conceptual climax of the chapter and the bridge to its end. *Versäumnis* is not negligence but a structural feature of care: in caring for one thing a care *expels* what it does not care for, treats it as what-ought-not-to-be — and the deepest charge is that the care for known knowledge omits *precisely what it claims to secure*. Heidegger announces that exhibiting this omission will both confirm the diagnosis and lead, through the critique of historicism, to the *Dasein* that has been omitted.

He underlines that this omission is not a forgetting: what is omitted is omitted *in the manner of the care*, not forgotten but *expelled* — the care *defends itself* against what it omits. Then he names the omission concretely. The theme is consciousness, the lawfulness of every possible comportment; this lawfulness is ideal and grounded in the *idea*, to be secured as norm-lawfulness so that a thoroughgoing and absolutely objective *norming of the whole being-there of humanity* is won — the task of the norm-science being to regulate and secure human being-there, that is, *culture*. But in the whole consideration it is never said *what* is to be normed; the being that stands under the norming is never put to investigation in the same originary sense — indeed it is expressly said that such phenomena as the "concrete I" and the "soul" are to be *switched off*. So what is to be normed does not come into the region of the proper theme at all. The point of calling this an omission is not that one must investigate what stands under the norm so as to cut the norm to fit it; it is far more principled: *the sense of norm and norm-lawfulness is not exhibitable so long as one does not make present what kind of being normed and normable being means*. The possibility of normativity cannot be clarified without putting the *for-what* of the norming — its being-structure — into the inquiry. The decisive omission is thus exposed. Husserl's phenomenology means to ground the *norming of human being-there* (culture) on absolutely valid ideas, yet it expressly *switches off* the very being that is to be normed — the concrete I, the

soul, the human — so that the *for-what* of all norms is never investigated. And Heidegger's charge is not the obvious one (that norms should fit their objects) but the radical one: one cannot even *understand* what a norm *is* without first asking after the *being* of that which is to be normed. The omitted is *Dasein* itself.

Why does this omission in fact obtain, why is the idea of norming discussed with astonishing unconcern? Because the idea of the norm is drawn from a wholly *isolated* look, itself pre-given by the care for known knowledge: it is drawn from the state of affairs of the *theoretical judgment*. A theoretical proposition is addressed; this addressed proposition is the underlay of the consideration, such that at it the difference between the *occurring judgment-act* and the *valid proposition-sense* is marked off — the latter objectively valid, always itself, while over against it the concrete judgment-assertion changes really. All that one characterizes as concrete judgment-making is *switched off* as the turbid appearance-form of the valid. On this narrow basis the distinction of valid idea and so on is won, and *formalizing and analogizing* transferred onto every conscious comportment. And since all interest stands at the *grounding* of such validity, all consciousness-research is so directed that it looks away in advance from what is to be normed. Heidegger has now traced the omission to its root. The whole theory of validity, ideas, and norms is generalized from one isolated phenomenon — the timeless validity of the theoretical proposition over against its changing enactments — by formalizing and analogizing; and because the interest is fixed on *grounding validity*, the inquiry is structurally turned *away* from the concrete, enacting, factual being (the judging *Dasein*), which is dismissed as mere turbid appearance. The privileging of the λόγος ἀποφαντικός diagnosed in §2 is here shown to be the silent foundation of the entire Husserlian edifice of validity.

We must learn to understand, Heidegger concludes, that this omission is not simply an overlooking, a non-attending to something that could be made up afterward, but that what is here omitted is omitted *in caring fashion* — and that is the proper sense of the *critique of historicism*. The chapter thus turns from naturalism to historicism: the same omission (of the being of the factual, enacting, historical *Dasein*) that the critique of naturalism reveals will be shown, in the critique of historicism, in its sharpest form — for there what is omitted is precisely the *historical* being-there of the human, expelled by the care for an absolutely valid, supra-historical science.

§ 13. Husserl's critique of historicism

a) The other ground of this critique

The question arises: how does *history* come into the field of vision at all within the consciousness-thematic? It was stressed that in principle, in this whole time and still today, the philosophical questioning is oriented at *science* and at *disciplines*; so history

comes in as the theme of a science or science-group — history as *scientifically known*, as *Historie*. Heidegger fixes from the start that "history" enters Husserl's purview only in its scientized form (*Historie*, historical science), not as the historicity of *Dasein* — a restriction that already prefigures what the critique of historicism will *omit*.

Husserl says introductorily that historicism is an *over-stretching* of certain scientific ideas; historical science, he says, has to do only with *facts*, its object belonging to the empirical fact-sciences. At first it is not to be seen how this question should have a connection with the idea of a philosophy as rigorous science. Contemporary with the epistemology of the time goes a philosophy that received its impulses from *Dilthey*. In the course of his intellectual-historical researches Dilthey came to fundamental insights into history: the "formation of historical consciousness" leads, by Dilthey's conviction, gradually to destroy the belief in the existence of an *absolute* philosophy — that is, here, knowing-of as knowledge. Much more than the conflict of systems, it is precisely the formation of historical consciousness that is a motive for seeing into the impossibility of an absolute philosophy. Heidegger remarks in advance that this tendency (Dilthey's) did *not* come to the clarity it claimed. The stage is set for a double-edged treatment. Dilthey's insight — that the development of historical consciousness undermines the pretension to an absolute, supra-historical philosophy — is, for Heidegger, a genuine glimpse of the historicity of existence; Husserl will reject it in the name of absolute validity, but Heidegger will hold that Dilthey, too, failed to win the clarity his insight demanded, because he lacked the ontology of historical *Dasein* that alone could ground it. Between Husserl's anti-historicism and Dilthey's historicism, the genuine question — the *being* of the historical being-there that the care for known knowledge omits — remains to be raised.

b) The human being-there as what is omitted in the deficient care for absolute norm-lawfulness

The leading question remains to understand consciousness in its being-character, and this becomes visible if we make concretely present the care that moves about consciousness as a determinate field of knowledge and ask after what it takes care of *at* it. The care alive in Husserl's critique is the care for the winning of an *absolute securing* of knowledge, which determines the whole critique in its choice and treatment of themes. Heidegger now deepens the concept of *Versäumnis*. The omission is itself something *taken care of* by the care; *omitting can be characterized as deficient caring*. Deficient is a being that in the way of its being does *Abbruch* — breaks off, damages — to that with which it is and to which it is related as a being. The omitting is thus itself a care, and a *deficient* one, such that the care cannot come to what, by its own sense, it takes care of. This is a precise ontological deepening: omission is not a gap but a positive *deficient mode* of care — a way of being that breaks off the relation to what it is

concerned with — and the care for known knowledge is deficient in exactly this sense: it cannot reach the very thing (human being-there) its own sense requires it to secure.

The care cares, among other things, *that it leaves something out*; to the being-character of care belongs not merely to be, but to be *thus* and to have determinate possibilities. This peculiar *Bewegtheit*, movedness, lying in the being of every care, meets us in the manner of omission. Omitting is not simply a leaving-out; since the care is concerned with the cared-for, it is also concerned with the *omitted* — the care cares that the omitted *remains* properly omitted and does not come into its way again. The care *blocks its own way* to what it omits, so as not to be disturbed in its omission. The movedness of care is brought out: a care actively *holds off* what it omits, barricading its own path to it, so that the omission is self-protecting — which is why the human being-there, once omitted, is kept at bay rather than merely overlooked.

What, then, is the cared-for? Absolutely justified bindingness of the *norm* for enabling an *ideal culture-formation* as the proper completion of the idea of humanity; a supposed *Not*, distress, of human being-there stands in view, to be removed in principle by the work on the absolute securing of the norms. So human being-there is itself co-present in the circle of the cared-for. And what is the omitted? In this care for absolute securing of the norm and for the development of a genuine lawfulness, it *never comes to the task* of considering human being-there itself; precisely what is to be secured as such does not come into the theme at all — first, it does not come into the theme in the fundamental way everything else does; second, it is dismissed as of secondary concern, as *cura posterior*. The full weight of the care rests solely on norm-lawfulness as such. The omitted is the *proper cared-for*: human being-there. It is not asked what it is; the idea of humanity and the concept of the human are left in an average contingency. This is the precise statement of the chapter's central charge. The care means to secure the norms that would perfect *humanity* — so the human is the very thing at stake — yet it never makes the human's *being* a theme, dismissing it as a secondary matter, so that what it most claims to serve is exactly what it omits. Heidegger announces the task of showing how the omitted looks, how the caring is deficient caring, how the care contrives *to keep human being-there from coming near, to make it harmless and hold it in this harmlessness*. The phrase "to make it harmless" already names the motive that §14 will expose as *anxiety*: the care omits *Dasein* because *Dasein* is a threat to it.

§ 14. Critique of historicism on the way of problem-clarification

Historicism too is considered more closely on the way of problem-clarification. One might think that in the discussion of historicism, in this field, the *concrete being-there of the human* would be encountered; but we will see that already through the *posing of the question* it is arranged that history as such does not come into view at all. The thesis

governs the whole section: the very form of Husserl's questioning guarantees in advance that history — and the historical *Dasein* — cannot appear.

a) Husserl's critique of Dilthey

In the critique of historicism, which likewise proceeds as a clarification of problems, a determinate *worldview*, as Dilthey developed it, is taken up — and Dilthey is drawn in such that he is *covered in advance with a slogan*. The possibility of understanding Dilthey's work positively in any sense at all is lacking; insofar as this work is from the outset brought under the slogan "historicism," the critique moves in the clarification of infelicities that lie in Dilthey himself, and in this critique unclarities are not clarified but *raised to the principled*. Heidegger grants that Dilthey himself *failed* with regard to the question how historical being-there as such looks, since he did not have the possibilities even to pose this question; but the tendency to construe him as some *normative* philosopher in order then to present him as a *relativist* is wholly foreign to his essence. One must let Dilthey's work stand as it is, not judge him by known and usual ideas of philosophy; one must learn to understand that his work was not empty reflection on history and historical consciousness but *historical work*, in which there gradually formed something like the possibility of a new and peculiar *Daseinsbewußtsein*, consciousness of being-there. Life in history was for Dilthey himself an *existence-possibility* he lived, but which did not come to transparency for him, because he himself still remained within the traditional history-consideration that Heidegger calls the *aesthetic history-consideration under the idea of humanity*. The critique turns to its own harm by taking up Dilthey's own unclarities and making them the occasion of refutations. This is the double-edged verdict promised earlier. Husserl's critique fails Dilthey by sloganizing him (forcing his work under "historicism" and reading it as relativism), whereas Dilthey's genuine achievement was *historical work* in which a new consciousness of existence began to form — yet Dilthey too failed, because he could not free the *problem of history* from *historical science* and remained in an "aesthetic" contemplation of history under the humanistic ideal. Both miss the *being* of historical *Dasein*, which is the genuine matter.

b) The historical being-there as what is omitted

Asking positively: what does the care for known knowledge omit in the critique of historicism? Here the characteristic moment of *Rückschein* makes itself decisively felt. How does history come into the field of vision at all? Only as a *thematic field for a quite determinate cognition-task*. In advance the possibility is cut off of seeing the *historical being-there itself* as such, of forming an originary relation to historical being; the question what historical being as such is cannot arise at all within this problem-clarification. History is fixed as the object of *historical science*, as a determinate unitary domain of *facts*; and insofar as historical science has determinate tasks of

consideration, history becomes, with regard to these respects, the *material* of historical consideration. The historical being-there is *degraded to factual material* for determinate tasks. This task is characterized: out of the concrete factual material of spiritual being-there the *shape-manifolds* are to be brought out as *shapes of sense* — a shape-consideration with exact analogies in organic nature (there too one can bring out the morphological), so that the idea of this history-consideration is a *morphology* or *typology* of historical occurrences. As material, the historical sinks still further into the role of the irrelevant: the respective individual is only the *exemplary material for the type*. Through this whole development of the idea of a historical consideration the historical being-there is *wholly degraded*; history comes into the field only as object of historical science, and the way to the historical as such is blocked. The care for known knowledge has *excluded human being-there from the possibility of encountering*; history is degraded one step further into a *material-pit and example-collection for philosophical notions*, and the tendency to get human being-there in one's grip is cut through. The reconstruction shows the mechanism of the omission: by casting history in advance as the object of a fact-science and then as the raw material for a typology of "shapes of sense," Husserl ensures that the *historicity of existence* never appears — history becomes a quarry of examples, and the historical *Dasein* is reduced to an exemplar of a type, harmless and unencounterable.

The omission, the care for the omitted, shows itself further in that the matter does not even rest there: the so-degraded history is now, in its degradation, admitted for the question of *what relevance history has for the idea of a philosophy as rigorous science* of absolutely justified lawfulness. History is placed in a respect about which it is never asked whether the respect has any sense at all; the posing of the question is *presupposed*. So it comes about that what is brought forward as positive work stands in *no* connection with the claim to *mathematical rigor* demanded for the idea of such a philosophy — it lacks, precisely at decisive points, the demanded rigor. Heidegger turns Husserl's own criterion against him: the treatment of history fails the very standard of mathematical rigor that "Philosophy as Rigorous Science" sets, because history is forced into a respect whose sense is never examined.

c) Origin and legitimacy of the opposition of facticity and validity

Whence, and by what right, is the opposition of *facticity* (*Tatsächlichkeit*) and *validity* (*Gültigkeit*) drawn? By what right is this opposition posited as the fundamental distinction for the whole consideration of beings? Even within science Husserl distinguishes science as *objective validity-unity* and science as *factual culture-formation*; every science is so divided. Since *Historie* has to do only with facts, it wants to study them only in their facticity; one therefore *cannot*, from the study of the history of philosophy, from the study of the factual, make out what science as objective

validity-unity is — and on the ground of this difference not only history but also historical science is switched off as irrelevant. The real point of the question is the difference between the *factual* and the *valid*: first, whence is this difference drawn; second, if drawn from a determinate concrete ground, can it be extended to *every* spiritual formation? Heidegger answers: this difference is drawn from *theoretical comportment and judging*, where one distinguishes the *valid sense* and the *facticity of the judging comportment* — and this difference is *absolutized*. Here the omission makes itself felt in a quite fateful sense: a strictly matter-based investigation is foregone and a *banal Platonism* is called in. The genealogy is the same as in §12: the validity/facticity opposition is generalized from the single phenomenon of the timeless judgment-sense versus its temporal enactment, and then universalized into the master-distinction governing the treatment of all beings — a "banal Platonism" substituted for an investigation of the matter.

This difference is not invented by Husserl but *pervades the whole history of philosophy*. The peculiar development of intellectual history beginning at the close of the eighteenth century, which one designates as the development of *historical consciousness*, first becomes concretely transparent for Dilthey; but he did not get far, because he lacked the methodical training necessary as preparation, and because the possibility of treating the *problem of history* wholly detached from *historical science* remained covered to him. The division of valid and factual is taken over, in the stock in which it dominates traditional Platonizing philosophy, simply without the least change. In the critique of historicism it shows itself that the care *switches off* what it takes care of — absolute validity in the sense of the formation of the idea of humanity requires the *being of the human* and its proper interrogation, and precisely this the care excludes. The conclusion ties §14 back to §12: the unexamined Platonism of validity-versus-fact is the very instrument by which the care omits the being of the human it claims to perfect.

d) The reproach of skepticism, and the care for known knowledge showing itself therein as anxiety before being-there

The critique strikes its main blow by bringing historicism to the argument from *skepticism*: "consistently" thought through, all historicism leads to skepticism. Heidegger considers the critique in three respects: how the care for known knowledge shows itself; how the peculiar *Not*, distress, of this care shows itself; and how the omission reveals itself in it. The care shows itself in that its *Rückschein* (in the reflected-shine there is always a relative blinding) makes itself felt, so that the position of historicism is *interpreted onto validity*: one claims that historicism says the truths are not valid in themselves but are only *taken* as valid by determinate humans for a determinate time. No attempt is made to see whether in historicism there does not lie a *possibility of determining truth otherwise*; the position is from the outset claimed in the sense the

critique itself chooses, so that absolute validity and factual holding-for-valid are set against each other. Further, the reflected-shine shows itself in that from the outset the idea of *validity* is set *equal* to the idea of *truth*, so that one says: if the idea of validity is not absolutely secured, then there is no science. But it could be that the idea of *absolute validity is senseless*, and that nonetheless — or rather precisely therefore — science is possible. The whole Husserlian argumentation is a *purely formal* opposing of valid and real temporal sense; another possibility within this alternative does not come into the horizon at all. The care, on the ground of its *entanglement*, is enclosed in what it takes care of, and the critique becomes *wholly unfree*. The diagnosis is exact: the critique never asks whether historicism might be groping toward a *different concept of truth* (one Heidegger himself will develop — truth as uncovering, historically enacted), because the reflected-shine of the care has already equated truth with absolute validity, leaving only the sterile alternative absolute-validity-or-skepticism. The entanglement makes the critique unfree.

In this argumentation the proper *Not* of the care makes itself felt. The demonstration proceeds in a quite peculiar way: upon the principled refutation follows an *appendix* in which the real striking force is seen — "therewith all the propositions I now utter become untrue." At this place the care for known knowledge makes a peculiar step: *it invokes what it omits*. In the demonstration the one to be refuted is shown *how being-there would be if there were no absolute validity*; one is *made anxious* with a sidelong glance at being-there. In its highest distress the care invokes *Dasein* as a possibly insecure one, and it invokes it *in order to push the consideration back from it*. In place of the decisive blow of the *argumentatio ad hominem*, the critique expressly takes what it always omits *into* the care and claims it for itself; by holding out the prospect of a possible being-there in this insecurity, it unexpressedly *summons* one not to take part in such a being-there. That is, unspoken, the proper sense of every argument that believes it can frighten with skepticism: *the care for known knowledge is nothing other than anxiety before being-there — Angst vor dem Dasein*. This is the culminating thesis of the entire Husserl-critique and one of the most important sentences in the lecture. The anti-skeptical argument secretly works by *threatening* the listener with a picture of insecure existence (a world without absolute truth) and counting on his recoil — so the argument's force is not logical but *affective*, an appeal to the fear of an ungrounded existence. The care for known knowledge, stripped to its root, is *flight from Dasein*: the will to absolute securing is at bottom *anxiety* before the insecure, finite, historical being-there that it omits and expels. The whole diagnostic vocabulary (Rückschein, Verfallen, Verfängnis, Versäumnis) is here gathered into its existential ground, anxiety — the affect that *Sein und Zeit* will make the disclosure of *Dasein's* being.

e) The pre-opinions about being-there alive in this care

In this case quite determinate *pre-opinions* about being-there are alive, of which this seemingly radical critique gives itself not the least account. Heidegger names three: first, the argumentation grounds itself on the assumption that the human to whom it is addressed is *at all costs* out to experience and preserve the truth; second, the pre-opinion that *truth is validity*; third, the pre-opinion that truth and the being of truth can be *proven by theoretical deduction*, and conversely that the denial of truth can be led *ad absurdum* by a theoretical deduction. Each pre-opinion is then weighed.

Ad 1: is it so settled that human being-there wants to know the truth at all costs? Or does it not rather lie in human being-there to *go out of the way* of the truth and feign for itself a *phantom* in its place? The question is not settled and must be brought to decision — or, if undecidable, held open as such; only in the *research of the being of human being-there* can anything be made out about it. And what if it should even turn out that today, precisely on the ground of *traditional philosophy*, we are not yet in a position to make human being-there an *ontological* theme at all? Is there even the possibility of pressing through to *Dasein*? Heidegger refuses the cheerful assumption that humans want truth; he raises the counter-possibility that *Dasein* flees the truth and lives by a phantom (the everyday flight already named in *Verfallen*), and makes the whole question depend on an *ontology of Dasein* that the tradition may have made impossible — so that the very task of *Sein und Zeit* is here posed as a question.

Ad 2: it is presupposed that truth *is* validity — in the horizon of validity, being-true is interpreted as *Geltung*, a falling-phenomenon theoretically absolutized as far back as Plato's "Ideas." Validity is a character of the *uttered* proposition, of finished cognition insofar as it has become *public*, oriented to communicability, transmission, and appropriation; validity is the way truth is *publicly there*. But this peculiar aspect in which truth publicly subsists is so constituted that *it has already given truth out of hand*. The supposed possession of a validity is not yet guaranteed, since to truth belongs a specific *readiness of access* to the being that "truth" uncovers, and the possibility of *preserving* the encounter of the being in its originariness — the *Umgangsursprünglichkeit*, originariness of dealing — since the being we have appropriated keeps getting lost on the ground of the wearing-down of possession. The equation of truth and validity is not without further ado transparent; above all, truth interpreted as validity *covers precisely the decisive problems of being-there*. It is a question whether for historical cognition the interpretation of truth as validity has any sense; still more questionable for philosophical cognition; and most impossible for the "truth" of *art* and *religion*. This is Heidegger's positive counter-thesis to Husserl, and the seed of his lifelong rethinking of truth. *Validity* is only the mode in which truth is *publicly* deposited (in the communicable, transmissible proposition) — and as such it has *already lost* the truth, because truth is originally an *uncovering* that requires a readiness of access to the being and a preserving of the originary encounter against the

wearing-down of mere possession. To equate truth with validity is to absolutize a *falling* (public, second-hand) mode of truth and to cover the truth-character of being-there, of history, of art, and of religion — domains for which "valid proposition" is senseless.

Ad 3: so it shows itself that the care for known knowledge, where it fights skepticism in the decisive arguments, is out to *enable its constant flight from being-there*; it is careful to look to *validity* and to look *away* from the possible prospect of an insecure being-there. The critique of historicism has, today and always, a special striking force, because the object of the critique — skepticism — *itself* stands in an unclarity, explaining itself with the very means it fights; skepticism is a *fruitful rebellion* against the externalization of philosophy, but is itself a *half-measure*. The division between skepticism and the absolutism of validity rests on an *unclarified basis* and is to be rejected as a whole; the difference of ideal and real being is not only not exhibited but is even, in its ownmost field, the theoretical, drawn only from a quite limited sphere — and the decisive guide, the concepts of *being* and *being-true*, are not grounded as is necessary for a science going to ultimate exhibitability. Therein shows itself a fundamental omission of the critique and of the positive research. But more important than this omission, which can finally be corrected, is the way the argumentation against skepticism finally falls into *distress*: it must resort to the *argumentum ad hominem*, following the possibility of holding fast to "historicism" to its last consequences and so directing it that the prospect of a being-there of determinate character offers itself — in the consequence of historicism it necessarily comes about that perhaps there is no longer the principle of contradiction, that all the propositions we now utter are false; and at this prospect of an insecure being-there the argumentation rests content, under the self-evident presupposition that those to whom the argument is directed take *distance* from such a prospect. The argument further presupposes that the human, in the decisive sense, is concerned to *preserve the truth* — a pure presupposition about the being-there of the human that has so far not come into view. So in the decisive argument against skepticism it shows itself that the care for known knowledge *entangles itself in itself* — that in the decisive moment it takes *refuge* in what it precisely flees. The section ends by gathering the whole critique: Husserl's strongest weapon against skepticism is, on inspection, an *ad hominem* appeal to the listener's fear of an insecure existence, resting on an un-grounded opposition (ideal/real being) and on un-clarified concepts of being and truth; and its deepest self-contradiction is that the care which flees *Dasein* must, at the decisive moment, *invoke* the very *Dasein* it flees. The path is thereby cleared for the positive task: to ground the concepts of being and truth, and to make *Dasein* an ontological theme — which requires the regress behind Husserl to Descartes.

§ 15. Sharper precision of the care for known knowledge

Heidegger explains that he rolled out the whole consideration of the decisive care underlying Husserl's critique in order to have a ground on which to decide concretely: which *being-character* does the consciousness posited as the thematic field of phenomenological research have, and how is this field won? We make the care present in order to learn, in it and out of its being-there-possibilities, which being the cared-for has. Before the final answer, he sharpens the care for known knowledge by three further questions: *as what* does this care lay out the cared-for; what is the *care for fidelity to the matter* (*Sachlichkeit*) earlier taken as the characteristic moment of the breakthrough; and in what sense is the care a care for the *rigor* of science. They hang together, and answering the first prepares the others.

a) The care for justified knowledge, for evident universal-bindingness

The care for known knowledge goes to *justified* knowledge, to last-valid knowledge that, with the compass of the propositions and proposition-unities it secures, makes up the proper *ground* for all science; it is care for a knowledge *justified by knowledge itself*, taken in advance as *scientific* knowledge. It is care for a determinate and last *scientificity*, and scientificity is itself determined as "binding all rational beings"; scientificity means bindingness for everyone insightful, and the care for it is care for an *evident universal-bindingness*, *Allverbindlichkeit*. The characteristic thing in this self-interpretation is that *what is to be known* in this knowledge is in advance *secondary*: primarily the care is out to create *any* possible absolutely-binding *kind* of knowledge at all. With this hangs together that in the concrete consideration of science, science is grasped as the *unity of a problematic and a method*; the care is directed at a determinately secured *questioning*. The question itself, what ultimately determines the question — the answer-tendency toward proposition-validity in the sense of *apodicticity* — decides *before* all interest in the interrogated matter; the interrogated, the matter, gets its proper being only through the development and right clarification of the question itself. So philosophy becomes the basic science in the sense that in it the establishing of last-valid propositions should be made possible; always only the question: how can the scientificity of a universal-bindingness be carried through? The matters themselves encounter primarily, in this care, *as problems* — as objective connections prefigured in determinate problem-directions. This is the precise determination of "as what" the care lays out its object: it lays everything out *as a problem*, that is, as an objective connection already cut to the demand for apodictic, universally binding propositions — so that the matter's own being is subordinated to, and shaped by, the prior demand for secured validity. The §10 analysis of the "problem" returns as the form imposed on all matters by the care.

b) "To the things themselves": the care for the matters prefigured by universal-bindingness

Therein lies that "to the things themselves" can here no longer mean: to make the matters present *freely from themselves* before a determinate questioning-mode; it means rather: *within this quite determinately prefigured problematic*, to let the interrogated encounter. Even so the watchword "to the things themselves" has a certain originariness over against the constructions of contemporary philosophy; but in the ownmost sense of this philosophy one sees this call grow out of a care that is *matter-inadequate*. The call is nothing other than the demand to *lose oneself* decisively in the care for universal-bindingness, to make present only the matters prefigured therein — so that this seemingly self-evident call "to the things themselves" lets the far more fundamental possibility lie *outside* the field of vision: to give beings so *freely* that only the corresponding *worthiness* of the being to be interrogated decides what is primarily the object of philosophy. Such a decision must free itself, in itself, toward the possibility that such knowledge has *nothing to do with* an idea of science taken over from mathematics, and that such decidability — from the freeing of the matters — perhaps first carries out the *proper sense of knowledge*. This is the full redemption of the warning of §6, that the maxim "to the things themselves" can hide the most narrow dogmatism. Husserl's "things themselves" are not the freely self-showing beings but the *matters already prefigured by the demand for universal-bindingness* — so the maxim, in its Husserlian execution, inverts into its opposite: a summons to lose oneself in the care for validity rather than to let beings show themselves and decide, by their own worthiness, what philosophy is to be about. Heidegger's counter-ideal is named: a knowledge freed from the mathematical idea of science, in which the *being itself* decides what is worth questioning — the ideal of his own phenomenology.

c) The care for the rigor of science as derived seriousness; the mathematical idea of rigor in its uncritical positing as absolute norm

We are now prepared to investigate what the demand for the *rigor* of science means for it. Rigor is what is taken care of, in a determinate *seriousness*, in a care. Insofar as not the speaking-ability of the *freed* matters is primarily decisive, but the *bindingness* and the possibility of its exhibition, the seriousness concentrates on developing this bindingness; the care for rigor is the seriousness directed at *groundability* and genuine grounding. This seriousness, insofar as it is grounded in the characterized care, is a *derived* seriousness: it does not have the originariness that could bring it to *risk everything* in the sense that first *what is known* is recognized as the determining. And not only here, but in our whole *science-history*, the *mathematical* idea of rigor has been *uncritically posited as the absolute norm*. This positing of a quite contingent idea of rigor has spawned a whole complex of questions — for example, how historical science is to be brought to the level of a rigorous science. But the possibility of a science's rigor cannot be ascribed to it *from outside*; it must be taken and developed *from the science itself* as a discovery of beings: rigor is no empty idea but something *concrete* that forms

itself out of the science itself. This distinguishes two seriousnesses and two rigors. The *derived* seriousness of the care for known knowledge concentrates on securing bindingness and so cannot risk letting *what is known* be the measure; and its rigor is the *one*, contingent, mathematical idea of rigor uncritically universalized — whereas genuine rigor grows from each science's own discovery of *its* beings (history rigorous in a way proper to the historical, not by imitating mathematics). This is among the lecture's most consequential methodological theses and underlies Heidegger's lifelong refusal to measure philosophy by mathematical exactness.

From the answering of these three questions it shows how the care *constantly entangles itself in itself*, and from this character of entanglement we now understand the characterization of the care fixed earlier — that every care grasps something, retains it, lays it out, devotes itself, and finally loses itself in the cared-for. The *Verfängnis*, entanglement, is a *movedness of the being-there of the care*. The chapter thus closes by binding the five moments (disclose, retain, explicate, devote, lose) back to entanglement as their root, and entanglement to the *movedness of Dasein* — so that the whole analysis of the care for known knowledge is revealed as an analysis of a *mode of Dasein's being*, the very thing the care omits.

§ 16. The disclosing of the thematic field "consciousness" by the care for known knowledge. Regress to the historical concretion of the care

So far, Heidegger says, we have at bottom only clarified that the care for known knowledge *develops* the cared-for by securing a problematic and method directed at it; that it displaces all possible fundamental questions back into the thematic field "consciousness"; that it *devotes* itself to the cared-for; and that it *loses* itself in "consciousness," insofar as this basic science of consciousness, as the establishing of a last bindingness, is determined not only as a possibility of the being-there of culture but as the ἡγεμονικόν — the ruling, governing part — of human being-there in general, so that in this last basic-positing the specific *lostness* of the care in the cared-for reveals itself. But the decisive question, *how the care comes to this cared-for*, has not yet been answered; so we are set the further task of showing that it is this care for known knowledge that *discloses* the thematic field "consciousness." The Stoic-Cartesian word ἡγεμονικόν (the ruling part of the soul) is pointed: the care for known knowledge so loses itself in consciousness that consciousness is elevated to the *governing principle* of human being-there as such — the supreme symptom of self-loss, and the exact point at which the regress to Descartes becomes necessary, since it is Descartes who first makes the *ego cogito* the ruling ground.

a) Circumspection and intention of the care

To understand this final demonstration, a short preparation is needed: to make present a not-yet-expressly-stressed moment of the care. Recalling the *omission* of a care, it is easy to see how in this peculiar manner of caring there lives what Heidegger calls the *Umsicht*, circumspection, of the care. *Every care as such is seeing*. That it is seeing is no external determination but is given *with its being*; a *Sichtigkeit*, sightedness, belongs to being in the sense of being *within a world*. This sightedness is, as such, there in every mode of human being (of *Dasein*), also in the basic mode of being-there, the care; and it has *nothing to do with theoretical knowledge* but is an enactment-mode of the *basic constitution of Dasein*, to be exhibited as *Entdecktheit*, uncoveredness (Heidegger cross-refers to the end of the lecture and to Part Two). These phenomena lie in a far more fundamental originariness than what is handed down to us by determinate theories. Every care has its determinate *Hinblick*, look-toward, alive in the care-enactment as the respectively self-enacting circumspection, which is not contingent but led by what is called the *Absicht*, the intention or aim, of the care; by this aim every step of the care is led. This is a decisive proto-*Sein und Zeit* analysis. Care *sees* — not theoretically but as *circumspection (Umsicht)*, the practical sightedness belonging to being-in-a-world (this is the *Umsicht* of the workshop-analysis of *Sein und Zeit* §15) — and this seeing is guided by an *Absicht*, an aim that directs the whole enactment. The terms *Sichtigkeit* and *Entdecktheit* (uncoveredness) name the pre-theoretical disclosedness that grounds all theoretical seeing, recovering at the level of *Dasein* the $\varphi\alpha\iota\acute{\nu}\omicron\mu\epsilon\nu\omicron\nu/\acute{\alpha}\lambda\eta\theta\epsilon\acute{\upsilon}\epsilon\iota\nu$ analyses of Part One.

It is to be shown how the so-characterized care, through the manner of the enactment of its look-toward, *discloses* a determinate to-be-cared-for — how the care for known knowledge in fact, in the course of its enactment, discloses the thematic field "consciousness." Decisive for us is how the care for known knowledge wins its specific thematic field at all, in how far it has the *aptitude* to disclose and retain something like "consciousness." The understanding presupposes an orientation about a basic peculiarity of all caring: that it is *sighted* caring, having the cared-for in view in some sense. The sightedness of caring is a character given *with Dasein itself*. *Dasein as being-in-a-world (In-Sein) is disclosing being*. What comes to expression in the term "in a world" is *not* that two objects are somehow related to each other, but that the specific being of the living grounds on *having the world in the manner of caring for it*; this orientation of a being insofar as it lives, that is, is in its world, is what we designate as *Sichtigkeit*. Every care lives in a determinate look-toward what it takes care of, and the circle of the to-be-cared-for is seen by the care through various possibilities of its peculiar seeing, led and guided by the look-toward, the *Absicht*. Here *In-der-Welt-sein* is stated in nearly its *Sein und Zeit* form: "in a world" is not a spatial relation between two present-things but the way a living being *has* its world by caring for it — being-in is

disclosing being. The whole machinery of circumspection and aim is now in place to explain how a care *discloses* a field.

b) Descartes' research as the factual-historical concretion of the care in its disclosing of the thematic field "consciousness"

The task now arises of understanding something still more originary: how a determinate care, determined by the *whereupon* of its looking-away-to, its *Absicht*, can disclose a to-be-cared-for — how, then, the care for universal-bindingness as such discloses and supplies a *being-field*. For at first the care for universal-bindingness is not at all related to a determinate being-field; the question is how the development of the care leads it to see the decisively to-be-cared-for at a determinate being-domain, to which it leads itself. The answer turns on *facticity*: every care is in its being a *factual* care — to the what-being of the care belongs its factual concretion of its being. Facticity belongs to the what-being of the care itself; this expresses itself in that the care is a *mode of Dasein*, and *Dasein as such is factual*. An originary consideration of the care and its being is thus led back to a respective *facticity*; it is important, in clarifying the care, not to make it into something being-indifferent toward the object. The argument is that one cannot understand how the abstract "care for universal-bindingness" comes to fix on *consciousness* as its field except by following the care into its *factual, historical concretion* — because a care is never object-neutral but is always *somebody's* care, enacted in a determinate historical situation.

And that concretion is given: the concrete mode of the being of the care for known knowledge, in which consciousness discloses itself as a field, is *openly given to us in the research of Descartes*. At this point a principled consideration must be introduced — the connection of our consideration with the *historical*. The regress to the historical concretion of the care is *not contingent* but *demanding by the sense of philosophizing*, in the sense that this care is to be sought in its originariness and *historical decidedness*. Descartes and Husserl are here *not arbitrary exemplars* of presentations of what we say about the care, but are *being-possibilities of the care itself*. From this it becomes evident that at the present point of our consideration we are *thrown back, from the analysis of the phenomenon "care," into history*, in the endeavor to win the proper being of this care and what it discloses. This is the methodological hinge of the entire lecture and the justification of Part Two. The phenomenological analysis of the care for known knowledge cannot complete itself in the abstract; because care is factual and *Dasein* is historical, the analysis is *thrown back into history* — and Descartes is not an illustration but the very *being-possibility* in which the care for known knowledge first concretely discloses "consciousness." The *Destruktion* of Descartes (and behind him scholastic ontology) is therefore not a historical excursus but the necessary continuation of the phenomenology of the present, the point at which Part One passes over into the regress

of Part Two. With this the First Part closes: the φαινόμενον and λόγος of the Greeks have furnished the horizon; Husserl's self-interpretation has been shown to be governed by the care for known knowledge, which omits the being of *Dasein* and is at bottom anxiety before it; and the analysis of that care has, by its own logic, thrown the inquiry back to its historical origin in Descartes.

ZWEITER TEIL: Regress to Descartes and the scholastic ontology determining him

Chapter One: Coming to an understanding about the regress to Descartes on the way of a recollection of what has so far been carried through

§ 17. The hermeneutic situation of the previous and the forthcoming investigations

The regress to Descartes that meets us out of the present situation of philosophy itself has not become transparent in its peculiarity; in the way Husserl's critique carried out the regress to Descartes, quite determinate failings spread themselves, so that the *manner* of the regress must be given more closely. Heidegger carries out the coming-to-understanding about the regress as a *Rück Erinnerung*, a recollection of what has so far been carried through — not simply a retelling but a *becoming-clearer-to-oneself* in re-running the previous course, which sets the traversed into a *sharpened horizon* and must more sharply stress the decisive drives in which the considerations live. Three things are to be brought to understanding: the ruling drives are determined by what stands in advance in view in all inquiry; how what is set in view in advance is *seen*; and how this taking-up of a determinate theme from a determinate situation motivates the *conceptual explication*. Recollection is here a methodological act, not a summary: by re-running Part One in a sharpened horizon, the inquiry makes its own presuppositions transparent before pressing on to Descartes.

So one must come to understanding about three things, which Heidegger now names with the terms that will become canonical in *Sein und Zeit* §32. The *Vorhabe*, fore-having: what is had in advance for the inquiry, on what the gaze constantly rests. The *Vorsicht*, fore-sight: the manner in which what is held in the fore-having is seen. And the *Vorgriff*, fore-grasp: how what is seen in a determinate way is conceptually explicated out of a determinate motivation. These are the moments of the *hermeneutic situation* out of which interpretation proceeds — ἐρμηνεύειν meaning to interpret in the sense of an interpretation that *keeps itself transparent about itself*. All characters of the hermeneutic situation are determined by the categorial of the *fore-had*; and the fore-had that accrues to these determinations is a *basic determination of Dasein itself*: the having, the seeing, the grasping are basic constitutions that spring forth *for Dasein*. This

is the first full statement of the fore-structure of understanding (fore-having, fore-sight, fore-grasp) that *Sein und Zeit* will make central. Its point here is reflexive: before interpreting Descartes, the lecture must make *its own* hermeneutic situation transparent, because all interpretation is governed by what it has, sees, and grasps in advance — and these are not arbitrary but rooted in the very being of *Dasein*.

Heidegger then states his own hermeneutic situation. The *Vorhabe* of the inquiry itself is *Dasein*. The *Vorsicht*, the whereupon *Dasein* is seen as such: *being* — *Dasein* according to its being, according to the possibilities and modes of its being. The *Vorgriff* is determined by the fact that the *being-characters* are explicated: *Dasein* is seen toward a *proper being-possibility*, toward *Existenz*, and this being-possibility discloses itself only in a radical hermeneutic questioning; explication is itself a being-possibility, describable in a radical questioning traditionally designated as philosophical. In this sense all these characters, as concerning existence, are *Existenzialien* — quite specific being-determinations that have nothing to do with the other *categories*, for categories always concern matter-laden, *worldly* being-domains. Here the *Existenzialien/Kategorien* distinction of *Sein und Zeit* §9 is stated outright: the being-determinations of *Dasein* (the existentials) are categorially distinct from those of worldly, present-at-hand beings, because *Dasein* is interpreted toward *Existenz*, a being-possibility that opens only in radical philosophical questioning. The fore-grasp of the whole lecture is thus an existential, not a categorical, conceptuality.

Heidegger recalls that the previous considerations divided into two at first separate inquiries: the clarification of the term "phenomenology," and the making-recognizable of what is today designated by it. Both show a unity of theme and a single-mindedness of method — both are carried out as the *interpretation of the pre-given onto Dasein*. φαίνόμενον and λόγος were interpreted onto *Dasein*: the showing-itself as a determinate possibility of the world, which can tip into a giving-itself-out-as-something, whereby the development into *Schein* becomes possible; and λόγος as a basic possibility of *Dasein*, the addressing and discussing of the encountering world. The second consideration already characterized itself, in the explicitness of its questioning, as one in which *being* is at stake: the thematic field "consciousness" was interpreted onto a determinate *care*, and the development of the field as a *mode of Dasein* — being-caring in this way is a basic kind of *Dasein*. What the final interpretation of the care for known knowledge brings out is that *care is the seized being-possibility* of what announced itself in the Aristotle interpretation. The unity of the whole is thereby exhibited: both Parts of the lecture are one method — interpretation onto *Dasein* — and the care for known knowledge is the concrete being-possibility of *Dasein* in which the structures won from Aristotle (self-showing, addressing, covering) are historically enacted.

In interpreting the care, Heidegger continues, we clarified it toward possibilities of being: reflected-shine, building-ahead, entanglement, omission; and the care for known knowledge is *flight before Dasein* as such. From here we understand the further question, what it means that consciousness becomes the thematic field: consciousness as thematic field comes to its priority through a *care of Dasein itself* — *Dasein flees before itself* and gives up the possibility of radically sighting and grasping itself. This is the sense of the seemingly harmless process that consciousness becomes the thematic field. The whole diagnosis of Part One is thus restated in one sentence: the elevation of consciousness to the master-theme of philosophy is *Dasein's flight from itself*, and the seemingly innocent, technical event (consciousness as the field of a rigorous science) is the disguised form of an existential evasion — which is precisely why its origin must be sought, by *Destruktion*, in Descartes.

§ 18. Becoming-free from the discipline and the handed-down possibilities as becoming-free for Dasein. Ontological investigation of Dasein as Destruktion

Both inquiries — the clarification of the term and the characterizing of what it designates — are *not* oriented at a pre-given discipline; their peculiarity is that they lead *out* of the discipline onto a peculiar phenomenon-connection: *Dasein*. Becoming-free from the discipline *for Dasein itself* means: to seize the possibilities of making this *Dasein* itself the theme of a research *determined by it itself* — a research that is nothing other than a possibility of *Dasein* itself. This is the methodological self-understanding of fundamental ontology: it is not one discipline among others (not psychology, not epistemology) but a being-led *out* of the disciplinary frame to *Dasein*, and the inquiry into *Dasein* is itself an enactment of *Dasein's* own being — philosophy as a possibility of existence, as the *Vorbemerkung* already said.

This becoming-free for the state of affairs "Dasein" is carried out in a becoming-free *from* handed-down possibilities and traditional ways of determining this being and ordering it into the general questioning of philosophy. We must make clear that all previous research that in any sense bore on *Dasein* — under the titles experience-stream, reason, life, I, person, and so on — shows a *basic omission*: that of interrogating, first of all, the being it treats as to its proper constitution. It must show itself that all previous philosophy, on the ground of its origin, was *unable* to determine this being, taken into the fore-having, more closely as *Dasein*. What has become known as "*Lebensphilosophie*" is a tendency toward living *Dasein*; but at bottom it shows how little it has understood itself and its basic task — "life" designates a mode of being for which *every category from previous ontology fails us*. This is the same omission diagnosed in Husserl, now generalized over the whole tradition: the inherited names for *Dasein* (life, reason, I, person, experience-stream) all skip the prior question of the

being of what they name, and "philosophy of life," for all its orientation to the living, lacks the ontological categories its own object demands.

Heidegger weighs Dilthey once more. Dilthey, who developed the greatest possibilities for grasping *life*, carried them out *reactively* and so *built over his own way to life*: in the tendency to bring life into sight and grasp, he was inclined to bring life into the *same* questioning as what one called *nature* — though he fought naturalistic psychology most sharply, he toiled at *psychology*, moving in the *same kind of seeing* as what he resisted, and so, in his whole tendency, did *not come into the open*. A much greater difficulty than the security of instinct and its maintenance is the *transparency* of the instinct. The verdict refines §14's: Dilthey's genuine instinct for life and history was sound, but he could not make it *transparent*, because he still saw life through the optical frame of the natural-scientific psychology he opposed — and the hard thing is not to have the right instinct but to render it methodically transparent, which is the task of fundamental ontology.

The interpretation onto *Dasein* faces a peculiar difficulty that can only be exhibited, not overcome: every attempt to experience *Dasein* originally *lives out of* today's situation of the interpretation and conceptual determination of *Dasein* and life — a situation thoroughly dominated by the old *ontology and logic*, which counts to everyone today as self-evident. So the task of *freeing Dasein* and winning explications at it is necessarily bound with the task of *shaking today's Dasein*, which is *ontologically built-over*, in this its built-over-ness — of *dismantling* it such that the basic categories *consciousness*, *person*, *subject* are led back to their *originary sense*, in the sense that, from insight into the origin of these categories, one shows that they grew on a *wholly other ground of being-experience* and are, by their concept-tendency, *inadequate* to what we want to bring into view as *Dasein*. This is the rationale of *Destruktion* and the hermeneutic circle of fundamental ontology: one cannot reach *Dasein* directly, because one always already understands it through inherited concepts (*consciousness*, *subject*, *person*) that distort it; so freeing *Dasein* requires *dismantling* those concepts back to their origin and showing their inadequacy — the regress to Descartes is the concrete enactment of exactly this.

Every ontological investigation of *Dasein* is as such *destructive* and stands in inner connection with what one calls *historical consciousness*. Our *Dasein*, today's *Dasein*, is nothing isolated; in the basic stock of its possibilities it is a *still-being-there*, a *having-been* of an earlier. So *history* is not something arbitrary lying behind us, an occasion for some *Geisteswissenschaft* busy-ness, but is *something we ourselves are*. What, by contrast, is presented to us as the *past* is not past at all but *bad present*; it matters first of all to *disclose* the past. Our historical consciousness (Heidegger names Spengler) is one that *strangles* history altogether — a sentence struck through in

Heidegger's revised copy — so that history and historical being are no longer spoken of at all. Every historical orientation is to be seen not as a contingency but as a *determinate task prefigured from Dasein itself*. This is the doctrine of the *historicity of Dasein* (*Sein und Zeit* §6 and §74) in nuce. Because *Dasein* is its having-been, history is not an external object but the very being of the inquirer; the genuine past must be *won*, against a "historical consciousness" that, by leveling history into a present spectacle (Spengler's morphology of cultures, the target of the struck sentence), strangles it. The *Destruktion* is therefore the *positive* appropriation of history as one's own most possibility, the opposite of antiquarian or morphological history.

§ 19. Regress to the proper being of the care for known knowledge in its originary past as regress to Descartes

Heidegger applies the general determinations to the case at hand, asking: how and in what way does the interpretation of the care for known knowledge lead to Descartes? In the interpretation of Husserl we saw that in the positing of the thematic field "consciousness" a determinate way shows itself of going back to *Dasein*, taken in the concrete sense, as to a determinate *exemplification of a universal*. Consciousness designates the compass of phenomena studied for structures that belong to *every* consciousness *qua* consciousness; being-human is only a *case* of this general being-possibility "consciousness." This connection is determined by a distinction of traditional *logic*: genus and exemplar of this genus. And here the decisive distortion shows itself: the *proper* connection of *Dasein* with its possibilities — a *historical* one — is, in the positing of "consciousness," *widened into a formal-logical connection* that does not care about being at all but only about a formal-logical ordering. This is the precise diagnosis of how Husserl loses *Dasein*. The concrete, historical *Dasein* is reconceived as a mere *instance* of the genus "consciousness," and its historical relation to its own possibilities is flattened into the logical relation of species to genus — a formal ordering indifferent to *being*. The regress to Descartes is the attempt to recover, behind this logical flattening, the historical being it conceals.

We will, as it were, *force* the answer by interpreting this research onto its *being-origin*; the determinations of the being of this consciousness will turn out to be such as lead back into the *old Greek ontology and logic*. We will see that the *new* that distinguishes Descartes is new only for an *external* aspect; that in Descartes no *break* shows itself but the *seizing of a prefigured possibility* we have already considered. The care for known knowledge is a being-possibility that *Greek philosophy* already determined being-wise, in the mode of the *absolute primacy of θεωρεῖν* among all being-possibilities of *Dasein*. This is the deep historical thesis of Part Two. Descartes is not an absolute beginning but the heir who *seizes* a possibility laid down by the Greeks — the absolute primacy of *theory* (θεωρεῖν) over all other modes of existence — so that the modern care for

certainty is the radicalization of the Greek privileging of the theoretical already exposed in §2 and §11. The "newness" of Descartes is superficial; his ontology of consciousness is built from inherited Greek and scholastic materials, which the *Destruktion* will excavate.

Heidegger restates the hermeneutic situation. Recollection is the reflection on the hermeneutic situation, on the situation of the interpretation itself. The most important characters: the *Vorhabe* as what stands in advance in view, that onto which everything that comes into view is interpreted — and the *Vorhabe* of the interpretation was designated as *Dasein*; that the whereupon the interpretation looks is called *Vorhabe* says that a *decision* has been made, that *Dasein* comes into the point of view of the inquiry. A proper consideration of the hermeneutic situation and of the moment of the fore-having would lead us to give account out of which *motives of Dasein itself* the decision for the theme "Dasein" was taken; the dissolution of the fore-having into the *Vornahme* (the prior undertaking), belonging to a more radical stratum, must be set back. *Dasein* has been interpreted toward *being*: it is interrogated as to its being-character such that out of its specific being its explicit "categories" are raised — though, more precisely, what was earlier called categories no longer comes into consideration. The being-character of *Dasein*, taken as being, we designate as *Existenzialien*, because *Dasein*, taken as a determinate possibility of its being, is called by us *Existenz*. This possibility is not always there; it is one that *grows in philosophical reflection*; it cannot be posited absolutely and as the *only* being-possibility. We see *Dasein* toward characters of its being; what stands in the sight are these being-determinations as *Existenzialien*, and their connection may *not* be analogized with any system of categories — the *Existenzialien* exclude a systematics in any sense; their connection is grounded in a wholly other way. What is so seen at *Dasein* becomes conceptually fixable through the interpretive marking-off, and the structure-connection of this conceptual explication is called the *Vorgriff*. Heidegger guards against two misunderstandings: existence is not a standing condition but a *possibility* that arises only in philosophical reflection (so the analysis is not a universal anthropology), and the existentials do not form a *system* like a table of categories — their unity is of a wholly different kind (the unity of care, as *Sein und Zeit* will show). The fore-grasp is the conceptuality won in this marking-off.

It already showed itself in earlier considerations, Heidegger continues, that the care for known knowledge today has the *dominance* in a peculiar way and dominates the questioning of philosophy — a dominance no longer controllable, *uprooted*, no longer knowing its own *origin*. One lives in the tendency to treat consciousness as the basic theme; for the care for known knowledge its *own proper being* is no longer visible. To get its proper being into view *at the care in its averageness* is impossible; one must go back to a *proper being of the care in its originary past*. This regress to the proper being

of the care, for determining its disclosing-being, is a going-back to a research-connection that bears the name "*Descartes*." The justification of the regress is now complete: because the care for known knowledge is today *uprooted* — dominant but blind to its own origin — its being cannot be read off its present, average form (Husserl); it can be reached only at its *origin*, where it first concretely disclosed consciousness, namely in Descartes. History is required not for illustration but because the present is opaque to itself.

§ 20. Destruktion as the way of the interpretation of Dasein. Three tasks for the explication of the disclosing-being of the care for known knowledge. The question of the sense of the truth of cognition in Descartes

The regress looks as if it were the deflection of a matter-consideration *into* a historical one. But the being of the care is a *being-historical*, such that it can be *uprooted* — as today the care for known knowledge is — and yet still be *historical*; for the proper being-consideration, an uprooting of the care does *not* mean that history has been *lost*: it is there *underground*. So we are already led nearer to seeing *Dasein* as something *covered by its own history* — by the history of its way of interpreting itself. The connection of category-research and logic prefigured by the Greeks dominates, to this day, the line of sight of what one calls *Dasein*; in every case, insofar as *Dasein* is to be brought into view, there grows the necessity of *freeing it from these conceptual overgrowths* that *Dasein* itself has developed for the purpose of its proper explication — but in which there shows itself today a peculiar tendency of *Dasein*: the *building-over-itself*, *Sich-selbst-verbauen*. *Dasein* has built itself over in the whole compass of its being. This is the deepest formulation of the need for *Destruktion*. *Dasein*'s self-interpretations, originally meant to disclose it, have hardened into a conceptual overgrowth that now *covers* it — *Dasein* "builds itself over" — and because the care is *historical* even when uprooted (history persists "underground"), the covering can be removed only historically, by dismantling the concepts back to their origin.

The freeing of *Dasein* on the way of dismantling, *Destruktion*, happens such that the concepts are led back to their peculiar *origin*; at the same time, on this way, the *inadequacy* of the concepts to *Dasein* is clarified, and the way in which the self-building-over of *Dasein* occurs *in history*. Heidegger then characterizes the destructive method under four points. First, this method of dismantling is *no historical universal method* but a quite determinate concrete way that arises from the necessities of *Dasein* and of categorial *Dasein*-research, and is in its effectiveness limited to that. *Destruktion* seems something purely negative; but it is to be considered that it does *not* seek out the *weaknesses* in what it takes up, but the *positive*, the *productive* — the *positive possibilities* of research are envisaged, and precisely at them is made visible where they have their *limits*. Into the compass of the task of *Destruktion* falls what one

briefly calls theological and philosophical work: the theological, because Christian theology has constantly lived hand-to-mouth and, in appropriating scientific-conceptual means, sought connection with the respective philosophy — since in theology too certain problems of *Dasein* are brought to language. Whether a theology is possible that draws its own conceptuality without borrowings from a philosophy is not discussed here; in any case theology has so far lived only from philosophy. Even Luther's originary approach was, in the first ten years after his breakthrough, *wholly buried over* by Melancthon and the renewed Aristotelian tradition. That the gaze is directed at the *positive* does not mean *Destruktion* should bring an *improvement* in the sense of separating the right from the false: the assessment of *Dasein*-history for truth and falsity is a *misunderstanding* of the cognition-kind of the philosophical and theological sense of truth. This is the crucial protection against misreading *Destruktion* as demolition (the seventh guard, stated by Heidegger himself). *Destruktion* seeks the *positive possibilities* of past research and the *limits* internal to them; it is not a sorting of true from false (a misunderstanding of how philosophical and theological truth work). The example of Luther — whose breakthrough was buried within a decade by the return of Aristotelianism — shows the historical mechanism of self-building-over that *Destruktion* reverses.

Second, *Destruktion* is in fact *critical*; but what is criticized is *not the past* disclosed by *Destruktion*, but the *present*, our today's *Dasein*, insofar as it is covered by a *past become inauthentic*. Not Aristotle or Augustine are criticized, but the *present*. The critique has precisely the *opposite* tendency: to make what it is directed at visible *with its originary past*, such that the originary kind of researching becomes visible and in our today's *Dasein* there grows something like a *reverence before the history* in which we live our own *destiny*. So *Destruktion*, as the critique of the today, is a critique that makes the *positive* properly, originally, visible at the past — and only thereby does the past first become visible as our proper *having-been* and *being-able-to-be-again*. This is the temporal-existential heart of *Destruktion*. Its critical edge falls on the *present* (the covered, uprooted *Dasein*), not on the great thinkers, whom it approaches with *reverence*; and its positive yield is to open the past as the *having-been* that is still a *being-able-to-be-again* — history as the reservoir of one's own most possibilities (*Wiederholung*, repetition, in *Sein und Zeit* §74). Third, *Destruktion* is in the proper sense *historical knowledge* and does not first need an *annex* of systematic questioning — it is not a preliminary to "real" systematic philosophy but is itself the genuine historical cognition. Fourth, *Destruktion* can never be *refuting*, such that one's own position is *protected* by refutation; therefore it may not be isolated as a self-running method of history-consideration but has sense only as *matter-disclosing research of Dasein* according to its being-characters. The fourth point guards against turning *Destruktion* into polemics or self-defense: it is not refutation in the service of a thesis but

the matter-disclosing of *Dasein* — bound always to the phenomena, never a free-standing historiographical technique.

Heidegger then names the *three tasks* for explicating the proper being of the care for known knowledge, its disclosing-being: to show that this care is in fact alive in Descartes' research-work; that this care is what discloses consciousness, and *how* it discloses it; and that through the determinate being of this care certain *being-characters* of what is disclosable by it are already *prefigured*. The first proof is purely external: it is easily established from the *Discourse on Method* that Descartes' work stands under the basic criterion of the *clara et distincta perceptio*. The proper task is the second — to show that this care discloses consciousness and how — and in this connection we are led to make the care present in its full content and then to determine more closely what is designated by the title "*truth*." This program structures the whole of the Descartes-interpretation: the easy point (that Descartes is governed by the criterion of clear-and-distinct perception) is granted at once; the real work is to show *how* the care for certainty *discloses* consciousness, and this requires clarifying the *concept of truth* at work in Descartes.

For the care of cognition is oriented at *truth*, and in this orientation at the truth of cognition a determinate *idea of truth* becomes visible. Heidegger announces that he will bring the sense of this idea near by *orienting "truth" onto Dasein itself* and asking in what sense truth belongs to *Dasein* at all — the *Augustinian question of the relation of veritas and vita*. By the historically developing orientation, since the Greeks, of the truth-concept at a determinate care of cognition, philosophy is entangled in an *impossible* questioning. The idea of truth that meets us in the care for known knowledge will turn out, in its proper grasp, *not* as a *character of cognition* but as a *basic constitution of life itself* — one that has been *torn out of its possibility* by a being-mode of the care. The beginnings for the *embedding of truth in Dasein* already show themselves in Greek philosophy at the term ἀλήθεια. This is the positive counter-doctrine promised in §14, now fully stated. Truth is *not* primarily a property of cognitions or propositions (truth-as-validity); it is a *basic constitution of life*, of *Dasein* — a way *Dasein* is, recovered from the Greek ἀλήθεια (un-concealment) — and the whole tradition's error, from the Greeks through Descartes to Husserl, is to have torn truth loose from life and lodged it in the care for secured cognition. The Augustinian *veritas/vita* question names the alternative Heidegger means to retrieve: truth as a way of *living*, not a feature of judgments.

We will first come to an understanding about the *phenomenon of truth* as the traditional treatment makes possible. *Dasein* as such does not at first appear at all in the connection of the truth-phenomenon: truth is seen as a character of *judgments*, of theoretical cognition, so that truth means as much as *validity* — insofar as cognition is

carried out in the manner of *uttering* the known, of taking the known up into the *proposition*, insofar as this proposition is communicable and needs an insightfulness for communication, certain phenomena are layered around "truth," and this whole complex is determined as the *epistemological* questioning in the widest sense. The precise interpretation of the care for known knowledge on the way of the Descartes-consideration must from the outset be oriented at: *which concept of truth and being-true is placed at the center in Descartes?* From there we will learn to understand more closely *how the being itself is* that is grasped *as true*. Our consideration centers in two directions on the phenomenon of truth: by reading off at it the manner of the caring and learning to understand the way it is prefigured, such that the care for known knowledge carries itself out *on the way of doubting*; and by grasping that *doubting* is an explicit kind of being-caring about cognition in the sense of taking care of a determinate *idea of truth*. The doctrine of being and being-true, as the Aristotelian one dominant in the Middle Ages, has passed over to Descartes — so that we are now set back to the *beginning* of the consideration. After this we are prepared enough to explicate *Dasein* itself in this direction and to see how far the farthest-advanced attempt of today's life-philosophy (Dilthey) comes in the tendency to bring life into the grasp and conceptuality of philosophical cognition. The program of Part Two is thereby fixed: Descartes' *doubt* is to be read as the concrete enactment of the care for known knowledge, a taking-care-of a determinate idea of *truth as certainty*; and because Descartes inherits the Aristotelian-scholastic doctrine of being and truth, the interpretation must descend behind him to Thomas — the regress to the "scholastic ontology determining him" announced in the Part's title.

Heidegger closes the chapter by guarding the sense of *Destruktion* once more. It is of *negative* character such that the *negation*, rightly understood, makes up the *proper of Dasein itself*, yet it may *not* be characterized as negative in the sense of *logical* negation. *Destruktion* itself takes, in what it determines for working-on, from the outset *not* the weak sides as its theme, but the *properly positive*, seen positively from the problematic that the interpretation itself drives. The final caution distinguishes the "negativity" of *Destruktion* from logical negation: the dismantling is negative only in that it removes a covering, and this removing belongs to the *positive* self-clarification of *Dasein* (whose own being includes a kind of negativity — the not-being-at-home, the nullity that *Sein und Zeit* will develop) — never a merely logical denial of past doctrines.

Heidegger adds a final clarification of *Destruktion* before turning to Descartes. It is no accident that this positive — not carried to a foreign opinion but the positive that is itself stressed in the phenomena — is at issue, insofar as, expressly or not, *in every philosophy it is about Dasein itself*. What is brought to investigation is placed into the theme on its *positive* side, and for *Destruktion* a different concept of truth is leading than the one popular in science. *Destruktion* is critical, and its critique has its positive in that

it directs itself at the *present* as that in which the enactment of *Destruktion* has its being-there — so that the critique of the historical is nothing other than the critique of the present, through which the situation of the interpretation itself is made transparent and critically loosened. Therein lies, further, that *Destruktion* is no history-consideration in the usual sense, above all not a *problem-history*: its historical orientation is not a running-through of a series of worldviews, but a *struggle with the past* (*Kampf mit der Vergangenheit*), such that the past itself is brought, through the proper objectivity of *Destruktion*, to *its own being* — to the aptitude for a *Rückstoß*, a thrust-back, upon the present itself. Only when the past is brought into this thrust-back-possibility does its objectivity arise, and for the present the being-bound-up with history. So for *Destruktion* it becomes visible that philosophical research cannot at all be dissolved into a systematic and a historical consideration: the kind of research lies *before* this distinction, is far more originary than the basis on which the division between historical and systematic is carried out. This completes the methodology. The "objectivity" of *Destruktion* consists in letting the past recoil (*Rückstoß*) upon the present, so that genuine historical work and genuine systematic work are *one* — both more originary than the academic split between "history of philosophy" and "systematic philosophy." The struggle with the past is the form in which the present makes itself transparent.

Chapter Two: Descartes. The how and the what of the disclosing-being of the care for known knowledge

In this tendency the interpretation is led, and in this way Heidegger now takes Descartes into the theme — with the aim of considering the care for known knowledge as to *how* and *what* it is disclosing. Cognition is to be established in the traditional sense, according to the determination-possibilities that have stepped forth through the work in cognition. The *dominance of theoretical knowing* as the proper measure of all cognition is so strong in the development of our intellectual history that even the phenomenon of *faith* was seen toward the phenomenon "cognition" — and that fundamental infelicitities arise from this is shown by a glance at the history of theology. The chapter's introduction restates the governing diagnosis (the primacy of the theoretical) and flags its damage even in theology, where faith was forced into the mold of cognition — preparing the reading of Descartes, in whom the same primacy reaches its modern form.

§ 21. Determinations of "truth"

Insofar as we lay these determinate concepts of cognition at the ground, Heidegger says, we must first orient ourselves about the *determinations of "truth"* and see how, out of the positing of an idea of truth, determinate possibilities of the *being of truth in life* result. He lists five. First, truth is taken as *das Wahre*, the true: the being that is

uncovered, there, in a determinate kind of cognition — the being in its proper uncovered self-being-there; scholastically, *verum id quod enuntiando ostenditur*, the true is that which shows itself in being-stated. In the "enuntiando" a further possibility is already pre-given. Second: the experiencing and originary having-there of a known being is carried out in one with its being-addressed and being-discussed; the known, uncovered being is the *about-which* of a speaking, and as discussed it is *spoken, uttered* — and the spoken, uncovered being we call the *proposition, Satz*, which retains in itself the being as uncovered insofar as it is spoken; in this being-spoken the proposition is *communicable*, a truth that can be accepted, contradicted, rejected. Third: the manner in which such a truth is itself there, as it were *free-floating*, so that it is no longer regarded with a view to the fact that it is *about a determinate being* — the proposition can be there in the manner of *being-repeated-after*, with the claim to join in the truth uttered in it; thus truth has, in publicness, the being-mode of a *validity (Gültigkeit)* whose mode of exhibition can change and can even be lacking. Fourth: this validity itself, passed around in various modes of being-uttered, has in itself, according to its origin, the possibility of a peculiar *exhibitability*; insofar as a validity is accepted such that the exhibitability itself is valid, the proposition is a *correct* one, a *Richtigkeit*, correctness; insofar as in assenting to the validity one assents such that what is assented to shows itself in the direction toward its *origin*, the validity has in itself the peculiar correctness-toward-the-origin as expressly appropriated — and this moment of correctness can be covered and lacking, while the proposition still raises the claim to bindingness. Fifth: insofar as one determines the bindingness of a proposition as what *ought to be acknowledged*, the proposition, as a valid one, is a *Gesolltes*, an ought; and if one determines the ought as *value*, one designates truth as *value, Wert*.

From this exhibition it must have become clear that *das Wahre* has determinate possibilities of being-there *in life*, and that these possibilities show a *growing distance* from what properly makes up the true: from the *being itself* in the *how of its being-uncovered*. Beginning at the last, truth as value, there is *nothing* there of the originary sense of truth; value-philosophy removes itself from the sense of being-true so far that the way to the exhibition of the proper sense of truth is *definitively blocked*. And this way of distancing is *not* contingent or set up for purposes of *Destruktion*: it is the way *history itself has made*, the way in which the interpretation of beings as the true moves. This is the historical-ontological thesis of the section and one of the most important in the lecture. There is a *descending scale* of truth's modes of being-there — from (1) the being itself in its uncoveredness, through (2) the proposition that retains it, (3) public validity (the "free-floating," repeated proposition), (4) correctness, to (5) value — and each step *removes* truth further from the being it originally uncovers. This scale is not Heidegger's construction but the *actual course of history*: the tradition has progressively lodged "truth" in the proposition, then in validity, then in value, losing the

φαινόμενον at each step. The *Sein und Zeit* §44 derivation of the propositional concept of truth from a more original uncovering is here laid out as a historical decline.

The tendency to this manifold of interpretation, Heidegger adds, is already laid down in *Greek philosophy*: apart from the fact that the Greeks did not take the originary sense of being-true seriously, the true was from the outset oriented as a *determination of the proposition*, and this orientation was reinforced by the special significance theoretical cognition has in the development of Greek philosophy — whence the further fate of the truth-idea is definitively determined. Only *once more* does a new attempt arise to give the idea of truth a new sense: in the *New Testament* and, following it, in *Augustine*. This new sense is naturally not expressly explicated in the Gospels; it would have been the *task of theology* to explicate such an originary sense of truth with the explication of faith — but theology *omitted* it. Even the "paradox" in Kierkegaard is nothing other than the result of the fundamental *omission* of the interpretation of the idea of truth. This is a striking historical-theological claim. There was a genuine alternative to the propositional-Greek concept of truth — the *biblical and Augustinian* sense, truth as a way of living (the *veritas/vita* of §20) — but theology failed to develop its own concept of truth and borrowed the Greek-philosophical one, so that even Kierkegaard's "paradox" is a symptom of that failure: the paradox marks the place where a non-propositional, existential truth presses against a propositional logic that cannot hold it.

§ 22. Three possibilities of the care for cognition: curiosity, security, bindingness

Heidegger now sharpens the orientation about the *care of cognition*, indicating that the care for known knowledge is only *one* determinate possibility, to be seen into other possibilities. The care of cognition can be characterized according to three possibilities: the care of *curiosity* (*Neugier*), the care of *security* (*Sicherheit*), and the care of *bindingness* (*Verbindlichkeit*).

The care of curiosity, first and originally, does not let itself be content with the having-known of a determinate section of beings that is there in life; it matters to it to develop, over a determinate region of being-known, the possibility of pressing ever *further* in knowing. It no longer matters *what* it knows, still less the *kind of being* of what it knows; the sole thing is that ever-new *possibilities of knowing* are there. So the care of cognition shows the peculiar character of *self-entanglement*, which Heidegger determines as a *self-supplying* (*Sich-versorgen*) in a double sense: it *goes up entirely in itself*, so that it only matters to be *able to see* — whereby the unreceptivity for the proper appropriation of beings grows (the interestedness in everything, even in religion and religiosity, dominant today, is a weak offshoot of this care); and it *supplies itself* in the sense that it *needs nothing else*, is self-sufficient, *unbedürftig*, needless — and as such it *fails* each time the claim is raised to make *earnest* with what it has known. This is the

proto-Neugier of *Sein und Zeit* §36: curiosity as the restless seeing-for-the-sake-of-seeing that never dwells with the matter, self-sufficient and unable to take anything seriously. Heidegger's aside on the modern "interestedness in everything, even religion" sharpens the diagnosis of his cultural present.

The care of security is the care in which it matters to cognition to carry itself out such that the knowing and the known are *known in this being-known*; cognition itself is brought into a determinate being-known. This is the *care for known knowledge* proper: insofar as it matters to have *cognition itself*, to give it *insightfully*, and insofar as it comes solely and primarily to *insightfulness*, it comes to show a special interest for *methodological* considerations — and the specific primacy of methodological considerations characterizes today's way of knowing. Here too it entangles itself in itself: first it is concerned with the *security* of possible cognition, so much that it accepts *seeing falsely* with respect to the *being* that is to be known; precisely in this connection a specific *blindness* grows for what is properly to be known. *Method* is here taken in a quite determinate sense: as the way to the winning of the *greatest possible evidence* — whereas method in the proper sense must mean that the *way to the matter itself* is opened and secured. This is the precise localization of the *Sorge um erkannte Erkenntnis* among the modes of cognition: it is the care of *security*, whose obsession with methodological self-grounding makes it blind to the *being* to be known, and which perverts the very idea of method (the opening of the way *to the matter*) into the securing of evidence. Descartes is its founder.

The care of bindingness mostly goes together with one of the first two and is out, not merely to enable ever more knowing or to know more securely with absolute evidence, but at a *dominance of knowing as such* — such that knowing prevails as that which goes *before* all possibilities of *Dasein* and determines them. It is characteristic that it *over-stretches* knowing itself, so that this care, speaking of itself, says: "the propositions of cognition bear the stamp of *eternity*." Therein shows a *presumption* of knowing toward itself, such that this cognition in this care *systematically covers over its own being-there-possibilities*; and an exponent of this farthest-going presumption is the way this care confronts *historicism*. This names the third and most imperial form — the will to make cognition the *governing* principle of existence (the ἡγεμονικόν of §16), whose hyperbole ("propositions bear the stamp of eternity," quoted from Husserl) covers over the finite, temporal being-there of the knower, and whose symptom is exactly the anti-historicist polemic dissected in §14.

In connection with these possibilities of caring stands the respectively dominant *concept of truth*. Taken together as historically having-been and still dominant today, it becomes evident that the present is, in the widest conceivable sense, *unprepared* for the question: *what does truth of life and of Dasein mean?* Both "pieces," truth and *Dasein*,

are in no way clarified — yet one is of the opinion that one has the means in hand to settle something about it. We must see whence today's dominance of the care of cognition has its origin, against which origins it is today *uprooted*. We consider the care for known knowledge because it appeared at a *decisive turning point* of the history of philosophy; but Descartes is a decisive turning point only in the way the *Today*, under the dominance of theoretical knowing, interprets itself and its history — *though Descartes is actually thoroughly medieval*. This qualification is essential to Heidegger's whole reading. Descartes is "the founder of modern philosophy" only in the *self-image of the present*; in his *ontology* he is medieval, working with scholastic concepts of being — which is why the *Destruktion* must descend behind him to Thomas. The "newness" of Descartes is a retrospective projection of a present that takes theoretical cognition as the measure.

Heidegger notes that in determining the true he did *not* draw on the concept of truth Husserl fixed in the *Logische Untersuchungen*, where truth is oriented at *proposition-truth* and determined as the *fulfillment of an intention* — truth consisting in the fulfillment of what is at first emptily meant. Corresponding to the different meanings of truth we ourselves have a determinate connection with the care of cognition: curiosity takes everything in only so far as it is *new*; the care of bindingness, unlike curiosity and security, does not one-sidedly seize a determinate possibility of existence-enactment but over-stretches knowing itself, so that knowing belongs in a stressed sense to the basic possibilities of *Dasein*. One must pose the question what kind of *being-mode in Dasein itself* the being-caring in the sense of knowing is, such that in it these determinate unfolding-possibilities are there being-wise. The section closes by referring the whole typology of cognition-cares back to the *being of Dasein*: each is a being-possibility of *Dasein*, and the task is to understand the being-mode of *Dasein* in which cognition, and its over-stretching, become possible — the question that Descartes, read ontologically, will be made to answer.

Chapter Three: Descartes' determination of the falsum and verum

§ 23. Preview of the question-connection

Heidegger recalls that Descartes' work is to be interpreted on three questions: the first (that the care is alive in Descartes); the second and *decisive* one — *which being-field does the care for known knowledge disclose?*; and the third — *how* does the care, as so being, have this being-field in this determinate being-character? With the answering of the second, the third is settled. What is it that the care for known knowledge *retains* in its care? First, what do "true" and "false" say, what does it mean that the care is out for *truth*? Second, which "*being*" is it that is designated as being-in-truth or being-in-error — what being-possibility within *Dasein* comes to expression in saying: grasping-truth or

erring? Grasping truth or erring are considered as to *what they are in Dasein*; which consideration of *Dasein* does Descartes lay at the ground? Third, which *way* is prefigured by this now-clarified being of the care? It will show that with the being-character of this way, quite determinate *possibilities* of what it can encounter, of what it can disclose, are already prefigured. The three questions fix the agenda of the whole Descartes-interpretation and keep its ontological orientation in view: the point is never Descartes' epistemology for its own sake but *which being* the care discloses (consciousness, the *res cogitans*) and *which being-possibility of Dasein* (the will-to-certainty) is enacted in it.

We orient ourselves first at the concept of *falsum*, asking: how does the necessity arise for Descartes to clarify the *falsum* as such; which determinations does he draw from the phenomenon of *falsum*; which moments does he take over from the tradition and contemporary philosophy? The *falsum* is first determined as *error*; the error as such is characterized as *malum*; and this, according to the traditional consideration, is as *non esse qua privatio* a determinate mode of *non-being*. From this consideration light must fall on the *verum* too. For the *falsum* is nothing other than the *cavendum*, what the care of cognition has *to avoid*; and through the determinate concept of the *cavendum* a determinate *view of the verum* is already alive. The question is whether Descartes determines the *verum* in the same fundamental orientation. One has so far *denied* this, holding that Descartes ascribes the *falsum* to the *voluntas*, the *verum* to the *perceptio* as the theoretical; but we will see that the characterization of the *verum* stands in the *same enactment* as that of the *falsum*. The methodological strategy is important. Heidegger reads *falsum* and *verum* together, against the standard view that severs them (will/error versus intellect/truth), because *falsum* is the *cavendum*, the thing-to-be-avoided of the care — so the whole structure of Descartes' theory of truth is governed by the care's flight from error, and *verum* is determined from the same source as *falsum*.

It must therefore be made intelligible that, on the ground of this peculiar interpretation of *verum* and *falsum*, the necessity in fact exists to assign the *falsum* to the *voluntas* and the *veritas* to the *ideas* or to the correlative grasping, the *perceptio*. Through the closer interpretation of *verum* and *falsum* we win the determinateness of *what the care goes for when it wills the verum*. Insofar as consciousness is in some sense disclosed by the care for known knowledge and held fast as a being-domain, then *through the orientation at a determinately laid-out verum and falsum it is decided about the being-domain of the matters*. Why through being-true it is also decided about *being* becomes intelligible only in the regress to the *ontology* in which the whole Cartesian inquiry is led; the interpretation must be led back to the *origin-connections*. In this regress to the provenance Heidegger will treat only the main station, and that not very fully: the fundamental sources for this explication — *Thomas, Anselm, Augustine*, with a short

glance at *Aristotle*. This states the deepest thesis of Part Two: in Descartes the determination of *truth* (*verum/falsum*) *decides the determination of being* — because the being that counts as real is the being that satisfies the criterion of certain truth — and this entanglement of truth and being is *inherited* from scholastic (ultimately Aristotelian) ontology, which is why the regress to Thomas (§§29–33) is required. The conversion of *verum* into *certum* will turn out to carry with it a decision about what *is*.

§ 24. The *cogito sum*, the *clara et distincta perceptio*, and the task of a being-wise securing of the truth-criterion

Descartes calls his inquiries those *de prima philosophia*, and the idea of *prima philosophia* is *Aristotelian*; the designation springs from the fact that Descartes saw quite clearly that he moves in the compass of the *ontologia generalis*. It is thus *not* a *prima philosophia* in the modernized sense, but the *consciousness of the connection with the questioning of the old ontology* speaks out of it. This is the foundation-stone of Heidegger's whole reading of Descartes (and the redemption of §22's "Descartes is actually thoroughly medieval"): the *Meditations* understand themselves as *first philosophy* in the Aristotelian-scholastic sense, ontology — so the *cogito* is from the start embedded in an inherited doctrine of being, not an epistemological fresh start.

Heidegger turns to what Descartes found as *true*: the *cogito sum*, or better, the *res cogitans qua ens*. *Cogitatio* equals *intentio*: by the name of *cogitatio* Descartes understands all that happens in us, we being conscious of it, insofar as there is a consciousness of it in us — so that *cogitatio* roughly coincides with the concept of the *intentional Erlebnis* used today in phenomenology, and the *res cogitans* is something that *is* as a manifold of such experience-possibilities. With the grasping of the being of the *res cogitans* the *criterion* for the evidence of this grasping is co-grasped, for *cogito* says *cogito me cogitare*. Heidegger fixes two things. *Cogitatio* is not experience merely directed at something but experience that *at the same time has a consciousness of itself* (the *cogito me cogitare*) — so the *ego cogito* that marked the "act" in Husserl (§5b) is here at its source. And the criterion of clear-and-distinct perception is *given with* the *cogito sum* itself: in this first cognition there is nothing but a *clara et distincta perceptio* of what I affirm, whence Descartes posits as *regula generalis* that all I perceive very clearly and distinctly is true.

The decisive difference between the Cartesian and the modern orientation, Heidegger stresses, is that *for Descartes the criterion as such does not suffice*. Descartes experiences, in uttering *cogito sum*, that his *assent is drawn* to assent to the proposition so grasped; but he says he cannot, for the *founding* of cognition, rely on a *dark connection* of this being-drawn — he must have the *clara et distincta perceptio itself secured being-wise* (*seinsmäßig*), and the *regula generalis* must be justified as the

possible *absolute* criterion of cognition. Modern philosophy has characterized Descartes' proof of the criterion (the regress to God) as a *relapse into the old metaphysics*; but one must ask whether Descartes did not in fact see *more radically* in seeking a *further grounding* of the criterion — and Heidegger notes that Husserl concentrated the whole work of his last years on justifying the idea of *absolute evidence out of itself*. This is a crucial and unexpectedly sympathetic point. Descartes is *more radical* than his modern critics because he refuses to rest the criterion of truth on the mere *felt irresistibility* of clear-and-distinct perception (a "dark being-drawn") and demands that the criterion be *ontologically grounded* — and the parallel to Husserl's late labor on absolute evidence shows that the same demand drives phenomenology. The regress to God is not superstition but the form Descartes' radicality takes within scholastic ontology.

This task — to justify the criterion — leads Descartes to clarify the *falsum*; the analysis of *falsum* is determined by the necessity of the being-wise securing of the criterion. Heidegger sketches the movement. I have the criterion only *darkly* and must press to *proof*; so far I have only the *cogito sum* — no inference but a unitary representation, a co-perceiving of the *sum* in the *cogito*. Going down into myself, I find that I am a *res finita*, hence *imperfecta*, and so cannot have the ground of my existence in myself; I am led to exhibit a *ground* of my being-there. From the idea of God as infinite — which, as *idea*, is a *realitas objectiva* — Descartes concludes that God gave me existence, that all the positive in me stems from him; and if the positive in me is *god-created*, that is, *true*, then all that occurs in me *qua being* is a *verum*, so the *clara et distincta perceptio*, which co-constitutes the *perfectio* of my being-there, is *true*. If God exists and I owe him my being-there, he cannot be the cause of my deceiving myself; and the question then becomes: whence *error*? Only when it is shown that error *cannot stem from God*, according to his being, is the criterion of all cognition grounded being-wise and the possibility of *falsum as malum in the ens creatum* open. The architecture is now visible. The truth of clear-and-distinct perception is secured by the *creation-ontology*: because the *res cogitans* is *god-created*, its *perfectio* (clear-and-distinct perception) is *true*; and error must be located as a *privation (malum)* within the created being, not stemming from God. The whole theory of truth thus rests on the scholastic doctrine of *ens creatum* and *malum qua privatio* — exactly the inheritance the *Destruktion* means to expose.

Heidegger reframes the point in terms of the lecture's task. We seek which *positing of Dasein* lies in what one today means by *consciousness*; it cannot be a matter of establishing a determinate being-character of this objectivity, but of making intelligible the *connection with the foundation* these determinations have. All fundamental determinations — the evidence-priority of inner perception, the specific being-mode of the *person* — are *uprooted* from the ground from which they stem; they no longer carry their proper claim with them but *push themselves forward*, so that every attempt to

investigate today's life-philosophy on its foundation pushes into the void. Before all further determination we must make clear: *what does being-true mean?* We start from the *falsum*, examine how it is determined and which determination-means as *being-categories* are used; from there the ground for the *verum* is supplied, and from there the character of the *res cogitans* becomes visible. Descartes had a very determinate consciousness that the analysis of *verum* and *falsum* is of fundamental significance for his *Meditations*. Already a determinate concept of being-true shows itself, oriented primarily *not at judging but at the being itself*: the *clare et distincte perceptum* is *verum*. The whole inquiry is undertaken for the *grounding of the cognitions of modern natural science* and determines the theme of the Fourth Meditation; it concerns *error*, but not *sin* (*error boni et mali*) — though the determination of sin as *error* gives hints that the proper being of the human is seen in *failing*, in *error*; and it concerns error in a determinate restriction, the *ideae speculativae*, theoretical grasping and knowing. Two points are gathered for the lecture. The being-determinations of "consciousness" (the evidence-priority of inner perception, the being of the person) are *uprooted* from their scholastic origin and now circulate as self-evident, which is why life-philosophy cannot reach its own ground without the *Destruktion*. And Descartes' truth-concept is, at root, *not* propositional but oriented at the *being* (the clearly-and-distinctly perceived *is* the true) — which both anticipates Heidegger's own non-propositional truth and shows the truth-determination to be governed by the being-question after all. The hint that "sin as error" locates the proper being of man in *failing* quietly connects Descartes' theoretical error to the theological-existential theme of the Fall.

§ 25. Descartes' classification of the manifold of the cogitationes. The iudicium as locus for the verum and falsum

To gain a concrete picture of *where* the *verum* and *falsum* appear, Heidegger reconstructs how Descartes *classifies* the manifold of the *cogitationes* — a classification, he notes, by which Brentano (and through him phenomenology) is essentially determined. In the Third Meditation Descartes finds that order requires first distributing all his thoughts into certain *genera* and inquiring in which of them truth or falsity *properly consists*. *Verum esse* is a determinate *being* of a determinate *cogitatio*, as *falsum esse* is a determinate *non-being* of a *cogitatio*; which *cogitationes* come into consideration for this is first to be made out. The framing is decisive: truth and falsity are from the start cast as *modes of being and non-being of cogitationes* — being-categories applied to mental acts — so the locus of truth is sought within the *res cogitans*, and the question "where is truth?" is already a question of the *being* of cogitationes.

One class of *cogitationes* is the *ideae tanquam rerum imagines*, to which alone the name *idea* properly belongs. Heidegger warns that the term *imago* has bound to itself a

whole tangle of errors, insofar as one then took representations as *pictures of something external*; *imago rei* must be grasped far more *formally*, in the sense that the *idea* is something *as imago rei* — it *offers something to be seen*, *represents* something, and *representing* (*repraesentieren*) is the basic function of the idea. This is an important corrective (and a misreading-guard internal to the Descartes-interpretation): the *idea-as-imago* is not a little picture standing in for an outer thing but the *representing* itself, the letting-something-be-present — the same point as the φαίνόμενον/*Erscheinung* guard, now applied to the *idea*. Other *cogitationes* have, besides, other *formae* — willing, fearing, affirming, denying — in which I always apprehend some thing as the *subjectum* of my thought, but embrace something *more* than the likeness of the thing; and of these some are called *voluntates* or *affectus*, others *judicia*. Every *cogitatio*, whether *idea* or not, is *apprehending*; but in these others I grasp *more* of what is given — I am directed willingly, or related in the manner of being-affected (*affectus*), or I *judge*, that is, *assent*, say *Yes* (*judicium*). Here, Heidegger notes, is the root of Brentano's threefold classification — *Vorstellung* (*idea*), *Urteil* (*judicium*), *Affekt* (*affectus*) — that exercised a far-reaching influence on phenomenology; and *voluntas* is double-sensed, meaning both *any actualization of a psychic possibility* and *specifically willing comportment*.

Now, considered *in themselves*, the *ideae* cannot properly be *false*: whether I imagine a goat or a chimera, it is no less true that I imagine the one than the other. If I take an idea merely as such and do not *refer* the represented to something else, it cannot be false — for what is *true* is my *representing* of the represented, my *having-present* the idea; the concept of truth goes *primarily not on the content* of the idea but on the *imagining itself*. Insofar as I *am* representing, this my being-representing, *as actual being*, is *true* — and *why* this being *qua* being is true can be established only by regress to the *tradition*. Likewise no falsity is to be feared in the *voluntas* or the *affectus*: though I may desire what is depraved or what nowhere is, it is nonetheless true that I desire it — it is the *being of the cogito as such* that matters. Heidegger draws the decisive consequence with Descartes: there remain *only the judicia*, in which I must be on guard against being deceived. If *verum* says *esse* in the sense of the *cogito* — the presence of a *cogitatio* as *res* — then *falsum* must say *non esse* of a *cogitatio*; and the *judicia* have, by their being-character, the *possibility to be and not to be*. The crucial structural result: because *verum* means the *being* of a *cogitatio* and *falsum* its *non-being*, only the *judicium* can be false, because only it has the kind of being that can *fail to be* (can be a *non esse verum*) — and idea and volition, taken in themselves, are always "true" simply because they *occur* in consciousness. Truth and falsity are thereby decided by the *being-mode* of the act, exactly as Heidegger announced.

This determination of the *idea* as *in itself true*, Heidegger observes, goes back to the determination of *Greek philosophy* that the *αἰσθητά* as such are *always true* (the ἀεὶ

ἀληθές of §1): the sentence Aristotle *restricts* to the sensible nearest grasping and to certain graspings of the *voûς* is here *generalized* to *possible grasping as such*. This is a precise genealogical stroke: Descartes' thesis that ideas-in-themselves cannot be false is the *unrestricted generalization* of Aristotle's narrow claim that the proper sensibles are always true — the Greek doctrine torn from its ground (the analysis of perception) and extended over all mental representation.

Yet Descartes cannot miss that a certain falsity does belong to ideas, which he clarifies by distinguishing *ideae innatae*, *adventitiae*, and *a me ipso factae*; these differ in how hard it is to establish whether what they represent *extra mentem* is "true," that is, *real*. Though *formal falsity* (*falsitas formalis*) cannot occur in ideas — it belongs only to *judgments*, which have the possible being of *non esse verum* — there is in ideas a *falsitas materialis*. The idea's *esse* is only *to present*; when it presents, its being is satisfied; the idea is *materially* false when it presents *something that is not so as if it were* so. Heidegger gives Descartes' example of warmth and cold: feeling cold and warmth, I cannot decide which is the proper being and which the privation; the being-question of the *extra mentem esse* is oriented at a determinate being-concept, yet it is certain that these ideas *present* me something. If I come to say that *cold is a privatio of warmth* while the idea of cold gives me something *real*, I must say the idea is *false*, insofar as the proper being-consideration shows the cold to be a *non esse*; *material falsity* means the idea is a possible *matter* (*Stoff*) that, taken up into a judgment, becomes the possible falsity of a judgment. The distinction is important for Heidegger's argument: even the "falsity" possible in an idea is referred to *being and non-being* (cold as privation), and it becomes *actual* falsity only when the idea is taken up into a *judgment* — so the whole weight of *verum/falsum* falls on the *judicium*, whose being-structure (its capacity to *be* or *not-be* true) the next section must analyze through the inherited ontology of *realitas*.

§ 26. The distinction between the idea as repraesentans aliquid and its repraesentatum; realitas objectiva and realitas formalis sive actualis

The idea itself offers important differences. What is it *in* an idea that is met, in judgment, as that which is referred to something *extra mentem*? To clarify this, Descartes uses a distinction handed down from the tradition: that of *realitas formalis* and *realitas objectiva*. To carry his consideration through, Descartes must show, *from the basis of consciousness*, the being-there of *God*; and he does this by showing that in consciousness there is an idea of quite peculiar character, one having the character of a *realitas objectiva*. Heidegger stresses why the classification matters: only the *judicium* remains as the genus that can be false, and just because the judgment is equated with ideas and volitions in the respect that it *occurs in the res cogitans*, it has the possibility of a *defectus* — only therefore can it happen that with the *non verum esse* the specific

being of the judgment is *broken off* (*Abbruch getan*). The whole consideration is out to show, first, wherein the *being of the judgment* is constituted, and second, which being-determinations allow a *defectus* — which *defectus* makes up the *ratio formalis*, the proper being of the *falsum*. The framing keeps the analysis ontological: falsity is a *deficiency in the being* of the judgment, a privation (*Abbruch*), so the theory of error is a piece of the ontology of the *ens creatum*.

What the *judicium* is, Heidegger says, we know so far only *negatively*: the *cogitatio* in whose being the *falsitas* being-wise grounds. Descartes comes to the discussion of *falsitas* and *veritas* with the aim of not merely positing the evidence-criterion by appeal to a *dark consciousness* of the irresistibility of its insightfulness, but *strictly proving* it: it must be shown that the being of the *res cogitans*, insofar as it is an *actual* being, *excludes every error* — not only that the *res cogitans* is *created by God* in its being, but also that what occurs in it *realiter*, like error, is something that *cannot stem from God*. This leads to the explication of the *falsum*: insofar as *falsum* is in consciousness, it is to be proved that it cannot stem from God. Heidegger treats only the *pivot* of the God-proof, not its full course.

The pivot is the question how Descartes, from the ground that he *knows* the *cogito sum*, can get *beyond consciousness* — can show with the same evidence that *outside* (*extra mentem*) something exists. We have heard that the *idea* in its proper being is itself *true*, that the idea is what we called *knowing*, and that theoretical being-grasping lies primarily in the field of the *idea*. The question is where the starting-points lie for getting beyond consciousness to the affirmation of a being *extra mentem*; and to make this way intelligible Descartes introduces a distinction *within* the *ideae*. Considered merely as *modes of thinking* (*cogitandi modi*), the ideas show *no inequality*, all proceeding from me in the same way — every idea *qua* idea is an *esse cogitans*. But considered with regard to the *repraesentatum*, with regard to *what* each represents, they are very *diverse*. Heidegger fixes the distinction: taken as *acts* (modes of *cogitare*) all ideas are ontologically equal; taken as *representings-of* (according to their *repraesentatum*) they differ — and this difference of the *represented* is what opens the way out of consciousness.

The moment with respect to which the ideas differ is the *repraesentatum* considered according to the *being-sense the represented itself has* — the representing of a stone, of a geometrical object, of God — that is, according to its *modus essendi*; and this being-mode is the *realitas objectiva*. "Objectiva," Heidegger notes, here still has the *original* sense of the *held-against*, the *presented*: *realitas objectiva* is the being of a *res* insofar as it is *res repraesentata in an idea*. With regard to *realitas objectiva* there is a *diversitas* among the ideas, a difference of *majus* and *minus*: ideas that *exhibit substances* contain *more realitas objectiva* than those that represent only *modes* or

accidents — and this *majus/minus* is shown at the difference of *substantia* and *accidens*, taken from Greek philosophy, insofar as there the *being-superiority* of οὐσία over συμβεβηκός stands fixed, though "the ground from which this distinction was won is here no longer there." This last clause is one of the most important in the whole Descartes-interpretation: the gradation of representational reality (substance > accident) is *inherited* from the Greek ontology of οὐσία, but *uprooted* from the ground (the analysis of presence and the world-categories of §3) on which it had its sense — so Descartes operates with a scholastic-Greek being-hierarchy whose *origin he no longer commands*. Within substances the further difference of *substantia finita* and *substantia infinita* is made: I have among my ideas one that represents an *ens realissimum*, and considering myself in the same act as *res finita*, that idea gives itself as *creator*.

How is the *being* of what is represented in the *realitas objectiva* guaranteed by the mere givenness of such an idea? For this, Descartes draws on *general scholastic axioms*: nothing can come to be *from nothing* (*fieri a nihilo*); everything that is must have come into its being from *somewhere*; and this *causa* must be at least *equal* in being-character to what it effects, if not *superior* — so that nothing can be brought into being by an *aliquid minoris realitatis*. These axioms, perspicuously true of effects whose reality is *actual sive formal*, hold also, Descartes claims, of *ideas*, in which only the *realitas objectiva* is considered. A new concept thus appears: *realitas actualis sive formalis*, the being-mode that represents the *actual being of the object qua being*; and Descartes *transfers* the causal axioms from *esse naturale* to the *realitas objectiva* of the ideas — the being-content of what is represented requires a *corresponding causation*. He secures this against the objection that the axiom cannot hold because ideas have no *realitas formalis* of their own: he admits the proper being of the *realitas formalis* does *not overflow* into consciousness, but insists this does not prevent applying the causation-axiom, because the *realitas objectiva* is *not simply nothing but a Something*. The idea has not only the *modus essendi* as *realitas formalis qua cogito* but demands, by its very nature as *idea rem repraesentans*, a *realitas formalis* of the *res repraesentata* as its cause; and since I have the idea of God and I, as *imperfectum*, cannot have caused it, I must myself be caused by this *esse perfectum* — with the scholastic sentence that *God is his own being, Deus est entitas essendi sui*.

Heidegger draws the methodological conclusion. It becomes *clear* that Descartes *formalizingly transfers* the cause-axioms from *esse naturale* simply onto being in the sense of the *represented as such*; and he *can* do this because "objectivity" itself belongs to the *ens formale* of the idea — for the idea is a *making-visible* (*Sehenlassen*): with its being, something is also *brought into view*, and this being-brought-into-view "is" what it is, *with its from-which the presence of ... in the perceptio*, as a being of the respective *from-which*. If this from-which is God, then this *presence* cannot "be," cannot be *produced*, by me as *res finita*. The demonstration is valid, Heidegger says, *if one*

fully holds the *esse* of the *res cogitans*, of the *cogitare*, for the idea — that is, *understands it as ens creatum*. And for us this says: *Descartes sees in the being of the res cogitans a double being, in which the difference between esse repraesentatum and esse repraesentans coincides*. Here is the yield of the section for the lecture's argument. The Cartesian proof of the external world (and of God) *works* only on the presupposition that the *res cogitans* is an *ens creatum* — a *created* being whose representings carry the *realitas* of their objects — so the whole edifice of "consciousness" rests on the *creation-ontology*. And the being of consciousness is a *double being* (the act, *esse repraesentans*, and the represented-in-it, *esse repraesentatum*), the very doubling that Heidegger's φαινόμενον-analysis had located in the self-showing of the being — but here frozen into scholastic *realitas*-concepts. Descartes' consciousness, in short, is built entirely from inherited ontological materials (substance, accident, cause, creation, formal/objective reality), which is the proof Part Two was after: the "new" Cartesian *res cogitans* is *medieval in its being-determinations*.

Heidegger closes by summarizing the important moment of the ontological foundation: Descartes separates two *being-modes* of the idea — the being-mode *as cogitatio* (the *modus essendi mutuatus a cogitatione*, the being it borrows from my thinking) and the *modus essendi objectivus*, the being of the represented as represented. This doubling, won from the scholastic *realitas*-distinction, is the ontological frame within which the *res cogitans* — consciousness — is determined, and within which, in the sections to come, *error* will be located as a privation arising from the *concursus* of intellect and will.

Heidegger draws together the result of §26 once more before turning to error. Within the *res cogitans* Descartes *levels* a twofold being: the *esse* of the *cogitare* and the *esse* of the *cogitatum*. Both are an *esse animi*, a being at first independent of that of the body; and Descartes levels the *realitas objectiva* and the *realitas formalis* of the idea — a leveling possible because the *cogitare qua cogitare* and the *cogitatum qua cogitatum* are *equally evidently given*, can equally exhibit themselves as something (*aliquid*) present-at-hand. With regard to the *esse verum* both being-kinds are finally *identical*: both beings *are*, that is, are *created, created by God, that is, verum*. So the criterion of the *clara et distincta perceptio* takes over the function of a *leveling of the being-characters* — and this points to a peculiar enactment-mode of the care for known knowledge: it is met where, within consciousness, two different being-modes are leveled, so that both are subjected without hindrance to the *causal* consideration in the scholastic sense. This is the conceptual payoff Heidegger extracts. Clear-and-distinct perception, the criterion of certainty, *levels* the being-differences within consciousness (act and represented, formal and objective reality) into the single homogeneous being of the *created-and-therefore-true*, so that everything in the *res cogitans* becomes a uniform present-at-hand *aliquid* available to scholastic causal proof. The care for

certainty is thus, at bottom, a *leveling of being* — the indifference to the *kind* of being that Heidegger has tracked since §3.

§ 27. The question of the being of the *falsum* and error

A further clarification of the *esse* of the *res cogitans*, Heidegger says, is won through the interpretation of the *esse* of the *falsum* and the *error*; he follows not Descartes' own train of thought but only how the question of the *falsum* is posed and explicated.

a) The constitution of error: *intellectus* and *voluntas* as *libertas*; Descartes' two concepts of freedom

God is not only positively the cause of the idea I grasp; God can also *not* be the cause of a being like *erring* that is likewise in me. Descartes finds that his errors — which alone argue some imperfection in him — depend on *two causes running together*: the *faculty of knowing* (the *intellectus*) and the *faculty of choosing* or freedom of the will (the *voluntas*), in short the *intellectus simul cum voluntate*. Heidegger stresses the structure: each *facultas qua facultas* is a *positive* being-mode, and as *esse positivum* it is *esse creatum*, hence a *bonum* — so the being of the *falsum* cannot be a *malum* of either faculty taken alone. By the *intellect alone* I only perceive ideas about which I can pass judgment, and no error properly so called is found in it; the intellect *qua* faculty and as *ens creatum* is a *bonum*. The locus of error is displaced from the start away from the faculties and onto their *concursus*: since each faculty is created, hence good, error can lie only in their *running-together*.

One might object that errors do in fact occur, so why did God not make me such that I never err? For that, Heidegger reconstructs, my *intellect* would have to be like God's, *unlimited* with respect to the possible objects graspable; but it is *limited*, and within what it grasps it does not grasp everything with clear-and-distinct perception. Is this a defect? No — for the *limitation* of my intellect is *no privatio*. My present equipment can be determined as a *carentia*, a lack, only with reference to the *ideal* of God's constitution; but since I cannot *claim* this infinity, my *being-finite* is *no lack* — I cannot claim more. This is an important ontological point. *Finitude as such is not a privation*; the intellect's limits are a "lack" only by comparison with an infinite ideal one has no right to claim. (Heidegger's own thought will radicalize this: the finitude of *Dasein* is not a deficiency measured against an infinite intellect but the positive condition of its being.) The proof is needed, Heidegger notes, because for Descartes the *perfectio* of the human lies in the *will*, even though the explication of the will, following Thomas, runs toward the *intellect* as the *facultas eligendi*.

The *will* (the *facultas eligendi*, freedom of choice) is, by contrast, *circumscribed by no limits*: imagination and memory are limited, but the *voluntas sive arbitrii libertas* I

experience as so great that I apprehend the idea of no greater — and it is chiefly by reason of the will that I understand myself to bear a certain *image and likeness of God*. Here Descartes meets the tradition that determines the being of the human as *imago et similitudo Dei* (Genesis 1:26, *faciamus hominem ad imaginem et similitudinem nostram*); it is no accident that Descartes points out that the being of my *will* demonstrates my being as an *image and likeness of God*. God's will exceeds mine — by reason of the *cognition* and *power* joined to it, and by reason of its *object* (it extends to more) — but *not in its ens formale*, for considered *in itself*, formally and precisely, the will consists only in this, that we *can do or not do the same* (affirm or deny, pursue or flee), or rather in this, that we are so carried toward affirming or denying, pursuing or fleeing what the intellect proposes, that we feel ourselves *determined by no external force*. So the *esse formale of the voluntas* is *posse idem facere vel non facere*: the being-able-to-do and being-able-not-to-do with respect to one and the same proposed thing constitutes *libertas*.

In this determination, Heidegger observes, a *traditional* concept of freedom hovers before Descartes: freedom as *absentia coactionis et determinationis*, the proper school-concept — the *non-presence of a determinate being-directed at something*. Opposed to it stands the *Augustinian* concept of freedom, grounded in the thesis that *determinatio* is the *constitutive of libertas*, that determination is *not a lack* but the *proper being-mode of the will as a free one*. And here, Heidegger says, the proper *art of winding-through* that is frequent in Descartes comes to light: Descartes determines *libertas* as *absolute indifferentia* (we can do and not-do the same), and then, *seemingly without break*, gives a second determination in which freedom is grasped as a *libertas* in the sense of *absentia coactionis* but nonetheless a *being-determined* — being-free is *not* the merely indifferent being-able-to-do-the-one-or-the-other, but the *determinatum esse ad aliquid* proposed by the intellect, as something to be affirmed or denied, pursued or fled. Thomas is invoked: *appetitus* is nothing but a certain *inclinatio* of the one desiring toward something; to the *voluntas* belongs a *being-out-for-something-determinate*, not an indifferent having of possibilities — every *inclinatio* is *inclinatio in aliquid*, every *esse qua esse a bonum*, hence every *inclinatio* one *in bonum*. Descartes then says: it is not required for me to be free that I can be carried to *both* sides; on the contrary, *the more I incline to the one* — whether because I evidently understand in it the *ratio veri et boni*, or because God so disposes the inmost of my thought — *the more freely* I choose it. Here, Heidegger says, the *Augustinian* concept of freedom comes to light: the more originary the *propensio* toward the *bonum*, the more proper the freedom of acting; an acting that places itself wholly under God's will is *absolutely free*. This is the heart of the section, and a brilliant piece of *Destruktion*. Descartes *slides* between two incompatible concepts of freedom — the Scholastic-Aristotelian (freedom as *indifferentia*, the bare power to do or not do) and the

Augustinian (freedom as *determinatio in bonum*, fullest when the will inclines wholly to the good) — and he *needs* the Augustinian one for his theory of cognition: I am *properly free* precisely when I assent to what I clearly and distinctly perceive (*quod intelligo*), living in a *propensio in unam partem*, so that the highest freedom is the most *determined* assent. Indifference, the bare *posse*, is *not* freedom but the *infimus gradus libertatis*, the lowest degree.

Behind these sentences, which seem so self-evidently and freely set down, Heidegger uncovers the whole *contemporary background*: the rejection of *indifferentia* as being-free is a *blow against the Jesuits* and a *leaning toward Port-Royal* (the Augustinian, soon Jansenist, party). This is the first stroke of the genealogy that occupies the rest of §27: Descartes' theory of judgment is a *partisan move* in the seventeenth-century theological controversy over grace and freedom.

b) The concursus of intellectus and voluntas as the being of error. Theological problems as the ground of the two concepts of freedom

The *error* has its being in a *concursus* — not seen upon God but upon *two possibilities of comportment* given to the human himself. From the fact that the *facultas eligendi* and *intelligendi* are causes that *run together at once*, the question arises of investigating this *simul esse* of will and intellect more closely. This being-together must be *pre-determined from their own being*, and must yield a being that *carries the possibility of a defectus in itself* — a being that *is as it ought to be*; for only where there is a *debitum*, an ought, at a being can one speak of a *carentia*. In this being-together lies the being of error, *not* in the being of the *intellectus* as such *qua* faculty nor in the being of the *voluntas qua* faculty — that is excluded for Descartes, since the human was *created by God* in this constitution. The structural point: error is a *privation* (*Abbruch*, *carentia*) possible only where there is a *debitum*, an ought, and this ought arises only from the *right relation* of the two faculties; since each faculty is created and good, the deficiency can lie only in their *misrelation* — the will affirming where the intellect has not clearly perceived.

For the determination of the will's *infinity* a determinate sense of freedom is decisive: *libertas voluntatis* in the sense of *indifferentia*; and at the point where Descartes passes to determining the *positive* character, he begins with *indifferentia* and then attaches, seemingly without break, the further determination — a being-free in which a *determinatio* is present, *ad prosequendum vel fugiendum*. These two concepts of freedom, Heidegger now shows at length, have their ground in *theological problems* that have occupied theology since Augustine and were especially alive just when Descartes wrote the *Meditations*: the question of the connection between *grace and freedom*. For the theological questioning the *fact* of being-free is *indubitable* — that the human is free is no *veritas naturalis* but *dogma*, and every opinion doubting freedom is heretical; but the *natura voluntatis et libertatis* is *controverted*. The question of the sense of human

freedom moves in two directions, the *Aristotelian* (freedom requires a double *absentia*, *coactionis et determinationis*) and the *Augustinian* (a *determinatio in summum bonum* is constitutive: insofar as the will is directed at the highest good it stands under no *servitudo*). The general problem is twofold: how must the working of God's *grace* be determined so that human freedom is not destroyed, and how must freedom be determined so that it can submit to grace *without self-cancellation* — the possibility of a *concordia*, bound up with God's *praescientia* and *praedestinatio*.

Heidegger sketches the controversy that made these "problems of the day." Against the Protestant doctrine (Luther's *De servo arbitrio*, 1525), where human freedom is absolutely depressed, the *Jesuits* sought to *heighten* it; the doctrine of *indifference* was founded by the Spanish Jesuit Fonseca, developed by Bellarmine and by *Molina* (*De concordia gratiae et liberi arbitrii*, 1588), which determines human freedom positively without restricting grace. Against Molinism the Oratorian *Gibieuf* (*De libertate Dei et creaturae*, 1630) stressed the Augustinian concept extremely: the very *presence of a determinatio in summum bonum* makes up the human's proper being-free, so that grace cannot touch freedom because grace *first creates* freedom. Ten years later came *Jansenius's Augustinus* (1640), explicating Augustine's theology against Scholasticism and Molinism, against the background of the Pelagian and Semipelagian controversy. Molina's definition of the free agent — that which, *all requisites for acting being posited, can act or not act* — locates freedom in the *indifferent* being-placed-before both possibilities: "in the moment I have chosen, I am no longer free; freedom is cancelled." Augustine, by contrast, sees being-free precisely in this *determinari*, in placing oneself under a *bonum*. *Indifference* is indeed *findable* in the human will — this findability was the ground Aristotle discovered and on which he placed his concept of freedom — but it is *not findable as the constitutum of libertas*; only *qua creatura, as deficiens*, is indifference to be grasped. Heidegger's point in this dense doxography is to show that Descartes' two freedom-concepts are *exactly* the two parties of the grace-controversy, and that Descartes sides, against the Jesuit (Aristotelian, indifference) view, with the Augustinian: indifference belongs to freedom only as a *creaturely deficiency*, not as its essence.

This conception Descartes takes over for his interpretation of *error*. *Indifferentia* is the *infimus gradus libertatis*; the more I incline to the one — whether because I evidently understand in it the *ratio veri et boni*, or because *God so disposes the inmost of my thought* — the more freely I choose it; and *neither divine grace nor natural cognition ever diminishes freedom, but rather augments and corroborates it*. And here Heidegger states the decisive result. What is theologically designated as the *working of God's grace*, Descartes *transfers* onto the relation of the *intellect's working-in upon the will*: *the role of grace is taken over by the clara et distincta perceptio*. It is the clear-and-distinct perception that makes the judgment's specific *bonum* present, so that the *voluntas* is, in

its own being, *determined toward the intellect*, which gives it something in advance. So the *simul esse voluntatis et intellectus* is to be understood thus: as a *determinatio* toward a *bonum* belongs to the will's being, the *intellect* is what gives the will the *perceptum as prosequendum*; and *the more intimately the will holds to the clearly-and-distinctly grasped, the more properly the human is what he is*. The *willing seizing of the clare et distincte perceptum* is for Descartes the *highest being-possibility of the human*. And — the conclusion of the *Destruktion* — as soon as one looks to the *origin* of Descartes' sentences, one sees that the ground on which alone they have any *exhibition* has *nothing to do with a pure rational cognition*. This is one of the most consequential results of the whole lecture. Descartes' apparently purely epistemological doctrine — that I ought to assent only to what I clearly and distinctly perceive, and that this assent is the highest exercise of the will — is *structurally theological*: the *clara et distincta perceptio* occupies the place of *grace*, the will's free assent to it is the Augustinian *determinatio in summum bonum*, and the "highest being-possibility of the human" (clear-and-distinct cognition) is modeled on the soul's grace-determined turning to God. The rule of method that founds modern science rests on a *theology of grace and freedom*, not on "pure reason" — exactly the uprooting (the inherited, no longer commanded ground) that the *Destruktion* exists to expose.

§ 28. The being-sense of error: error as *res* and as *privatio*, as a breaking-off of the proper being of the created human (*creatum esse*). *Perceptum esse* and *creatum esse* as basic determinations of the *esse* of the *res cogitans*

Heidegger seeks the being-character of the *res cogitans*. A first *leveling* within it has shown itself: the *cogitare* and the *cogitatum* are moved into one unitary region of possible grasping by the *clara et distincta perceptio* — a leveling of the being-concept oriented at the *perceptum esse*, being-in-the-sense-of-being-perceived. A *second* determination of the being-character of the *res cogitans* is won by clarifying the sense of the being of the *cogitare* itself, by way of the being of *error*. What kind of *esse* is the *esse* of error, the *esse falsum*? The *falsum* is the *cogitatum* of error — so here too the leveling of *percipere* and *perceptum* shows itself, and it is no accident that the determination of the *esse error* is at once a determination of the *esse falsum*, both terms used by Descartes in the same sense. Insofar as the *errare* is *something*, it cannot be a pure *nihil*; on the other hand the *falsum*, with respect to the *verum*, is a *non-being* that is not a pure nothing — such a being is *privatio*. The ontological frame is fixed: error/falsity is a *privation*, a being-that-is-non-being, neither a positive thing nor sheer nothing.

Which positive moment of the *cogitare* can suffer *Abbruch* — can be affected by the *defectus* that makes the *errare* a privation? Descartes' general determination is: *simul esse voluntatis et intellectus*. Taken for themselves, intellect and will are *complete*, with

nothing of a deficient moment; the closer consideration leads Descartes to determine the *will*. *Voluntas* is *libertas*, and *libertas* is the basic determination of *humanitas*; and in this determination of human freedom the *theological connection* is decisive — human freedom is *read off the idea of God's freedom* as an *actus purus*, and the moments Descartes takes up from the contemporary discussion are *Augustinian*. Heidegger then traces the deeper pedigree. Augustine's determination of freedom as *determinatio in bonum* goes back, on a peculiar path, into *Greek ontology*, insofar as it is determined from the *Neoplatonic doctrine of the double movement*: all creaturely being wins its being *from the εἶναι*, is released from it, but has at once a tendency to *recursus* — to the being of the soul belongs the *return* to whence it comes. This formal determination entered Augustine's concrete explication of human being-there; the Jansenius-strengthened Augustinianism revived peculiarly in the nineteenth-century *Oratory*, and from this connection, Heidegger notes, even the philosophical foundations of *Scheler's* ethics are drawn. The genealogy is doing real work: the Augustinian freedom Descartes borrows is itself a Christianizing of the *Neoplatonic* return of the soul to the One, so that Descartes' theory of the will reaches, through Augustine, back into Greek ontology — and the same lineage is alive in Heidegger's own contemporaries (Scheler).

These connections are present in Descartes "*but in a peculiar way de-theologized*." It is the *verum* that motivates the *inclinatio voluntatis in iudicium*; the *verum* must, to be motivation-capable, be given *simul cum voluntate*, that is, as a *bonum* for the will or its *assensio*; and the enactment-form in which the *verum* is given is the *clara et distincta perceptio*. Being-free means, in the judgment, to *maintain the inclinatio toward the clare et distincte perceptum*; with this *inclinatio* a prefiguring is given that makes up willing-being and belongs to the human's *natura*. Since this being-free — the *determinari a clare et distincte percepto* — makes up the nature of the human and constitutes the proper relation to the intellect, the *being-determined* is something that *allows a defectus*. So the *regula generalis* for freedom is the *clara et distincta perceptio*; this holding-to the *perceptum* is the proper being-free, the *usus rectus libertatis*; and since this being-determined is a *belonging* being, it allows a *defectus* — the *defectus* consisting in this, that the specific enactment-mode does *not heed* this being-determined toward the *perceptum* and so *errs*. Erring is a *usus libertatis non rectus*; the *rectitudo* is touchable, and where it is touched, the *errare* is constituted. This is the precise mechanism. Truth (the *verum*, given as *clara et distincta perceptio*) functions as the *bonum* that draws the will's assent, exactly as grace draws the soul to the good (§27); the *right* use of freedom is to assent *only* to the clearly-and-distinctly perceived; and *error* is the *non-right* use — the will affirming where rectitude is not maintained — a privation of the proper, determined being-free.

Two characteristic moments thus belong to the being of error: insofar as it *is* a being, it is a *res*; insofar as it is a *defectio*, it is a *privatio*. God is still the proper *cause* of error insofar as error is a *cogitare*, a *res* (God is the author of whatever is); but insofar as the *errare* is a *non rectus usus*, it is *not* caused by God but springs from the *freedom of the will itself*. Heidegger cites Thomas (*Summa* I, q. 49, a. 2): the effect of a *deficient second cause* is reduced to the *first, non-deficient cause* (God) as to *what it has of entity and perfection*, but *not* as to *what it has of defect* — as the *limping* is caused, in its *motion*, by the motive power (a *bonum*), while the *obliquity* of the limp stems not from the power of walking but from the *curvature of the leg*, a *defectus*. The Thomistic analogy fixes the structure: God causes everything *positive* in the act of erring (its being as *cogitatio*), but the *deficiency* (the will's overreaching of the intellect) is the creature's own — so error is at once a created being and a self-incurred privation, and God is exonerated.

Heidegger gathers the explication into a chain. The *errare* has shown itself as a *deficere a determinatione*: in erring, *Abbruch* is done to the will's proper determinateness toward the *perceptum*. This *deficere a determinatione* is a *deficere a libertate*, for the *determinatio in bonum* is the proper being of *libertas*; and *libertas* is the *natura hominis*, so the deficiency is a *deficere a natura humana*; and the human nature is *as human nature created*, so it is a *deficere a natura creata*, a *deficere ab esse qua creatum* — that is, a *non esse creatum*. *The falsum is, in short, a non esse creatum*. And conversely: *non esse falsum* equals *non esse non creatum* equals *esse creatum*; so *non falsum* equals *esse verum*, and *esse verum* equals *creatum esse*. The chain is the conceptual heart of the whole Descartes-interpretation, and the proof of Part Two's thesis. Error is a *falling-away from created being*; falsity is *non-created-being*; and therefore *truth is created-being* — *verum esse* coincides with *creatum esse*. The "true" is the *god-created*, and the false is the privation of created being. Descartes' criterion of truth (clear-and-distinct perception) is thereby shown to rest on an *ontology of creation*: to be true is to be as God created one to be.

So with respect to the *verum esse*, both *perceptum esse* and *creatum esse* are characterized as being-determinations — a task discharged by clarifying how the *verum* is to be understood, a question Descartes does *not* expressly treat, though his whole use of *verum* and *falsum esse* shows that the scholastic doctrine of *veritas* and *falsitas* lies at its ground. Heidegger states the result for the *res cogitans*: it is, first, a being in the sense of *esse perceptum*; and the analysis of error has added a second basic determination, *esse creatum*. *Perceptum esse et creatum esse a Deo are the basic determinations of the esse of the res cogitans*. This is the answer to the second of Part Two's three questions (which being-field does the care disclose, and in which being-character): the care for known knowledge discloses *consciousness* (the *res cogitans*), and it has this field in the being-character of *being-perceived*

(clear-and-distinct) *and being-created* — two inherited, theological-scholastic determinations of being. The "newness" of the Cartesian consciousness is thereby fully dissolved: its very being is *perceptum esse* and *creatum esse*, both of which lead back to *verum esse* as the scholastic ontology determines it — which is why the regress must now descend to Thomas.

Chapter Four: Regress to scholastic ontology. The *verum esse* in Thomas Aquinas

What is the *foundation* of the two determinations of the *res cogitans* as *esse perceptum* and as *esse creatum*? To clarify this, Heidegger says, we must go *behind Descartes*, seeing a connection in the *scholastic ontology*. In advance: the proper connection between the *esse perceptum* and the *esse creatum* is founded by the *esse verum* — the being in the *how of being-grasped* is *identical* with being in the sense of *true* being, and the *esse creatum qua esse creatum* is characterized as *esse bonum et verum*. But with this merely propositional establishment nothing is yet won; to get the being-character of the *res cogitans* in our grip we are held to clarify how the sense of *verum esse* is determined *in scholasticism itself*. The regress to Thomas is thus not erudition but the only way to understand the being of Descartes' consciousness: both its determinations (perceived-being, created-being) converge on *verum esse*, and *verum esse* is a scholastic concept whose ontological structure must be excavated.

§ 29. The connection of the *verum* and the *ens*: being-true as a being-mode (De veritate, qu. I, art. 1)

The problem of truth was treated throughout scholasticism, following Aristotle, but only *high scholasticism* came to give the comprehensive doctrine; Heidegger interprets Thomas's *De veritate* (in the *Quaestiones disputatae*), noting that alongside this great *quaestio* stand questions of essentially *theological* character (*De scientia Dei*, *De praedestinatione*, *De conscientia*, *De libero arbitrio*, *De gratia*), while *De veritate* itself is *philosophical* in the sense of high scholasticism. The first *quaestio* is divided into twelve articles (what truth is; whether truth is principally in the intellect or in things; whether truth is in the intellect composing and dividing; whether there is one truth by which all things are true; and so on, down to whether falsity is in the senses and in the intellect). Heidegger takes only some pieces.

For understanding the whole doctrine it is decisive in *which connection* the discussion of being-true is placed, and the *first article* gives the answer. Thomas proceeds from a *methodical* consideration: every clarification of what something *is* must come out at the formal determination *ens*, such that by an *addere*, an adding, one wins the concrete determinations of an object. It stands fixed that *verum* is an *ens*; the question is then in

which connection the concrete determinateness of the *verum* stands with the *ens*. Can the connection be grasped such that the *verum* is a determination of the *ens* in the manner of an *affectio*, a thingly property? *No* — for being-true is no *thing* and no thingly property. The *verum* is a *modus* of the *ens*; the whole discussion of the being of being-true, directed at being itself, goes this way: the *verum esse* is to be grasped as a *modus* with respect to the *ens*. This is the first decisive structural insight Heidegger draws from Thomas: *truth is not a property of things but a mode of being* — a *modus entis* — which already lifts it above the propositional-validity concept and aligns it with Heidegger's own thesis that truth is a way of being.

Thomas distinguishes two *modi* in which determinations of being can be at all — and sets the explication, before any mention of *verum*, in wholly *formal-ontological* terms. There is the *modus specialis*, following the way the Aristotelian *categories* stand in being-connection with the *οὐσία* (yielding various *modi speciales essendi*), into which the being of the *verum* cannot fall, since it will turn out to be a *relativum*; and the *modus generalis*. The *modi generales* belong to every *ens qua ens*, while the *modi speciales* take the being with regard to a determinate *look*, its proper being — the categories valid of *concrete* beings. The *verum* belongs to the *modi generales*. Heidegger underscores why this matters: as a *general* mode of being, *verum* is a *transcendental* (in the scholastic sense) — a determination convertible with *being as such*, not a category of some region of beings — so the question of truth is, from the start, a question of *being in general*, the *prima philosophia* announced in §24.

The *modus generalis* can be taken in two directions: the *ens in se* and the *ens in ordine ad aliud*. The *ens in se* splits: taken *affirmatively* (the objective there), it yields the basic determination *essentia* or *res*; taken *negatively*, every *ens qua res* is something in its own right, *indivisible* in its being — and this *indivisio*, the formal-logical individuality, is expressed by the *unum*: *omne ens est unum*. The *ens in ordine ad aliud* also has a double possibility: *secundum divisionem unius ab altero*, by which every being, as divided from others, is an *aliquid* (*aliud-quid*, an other-and-not-the-one) — as a being is called *unum* insofar as it is undivided in itself, so *aliquid* insofar as it is divided from others; and *secundum convenientiam unius entis ad aliud*, the *accord* of one being with another, which introduces a *wholly new determination*. Heidegger notes that up to this point no *concrete* objective thing has appeared at all — the determinations (*res*, *unum*, *aliquid*) are purely formal modes of any being whatever. With *convenientia*, a concrete being is about to enter.

This *convenientia* — the manner of meeting, coming-together, agreeing — *cannot be* unless one takes a being whose very nature is *natum convenire cum omni ente*, born to accord with every being. Is there such a being that agrees with *all* beings? *Hoc autem est anima, quae quodammodo est omnia* — it is the *soul*, which in a way *is all things*.

The source, Heidegger shows, is Aristotle's *De anima* III 8: ἡ ψυχὴ τὰ ὄντα πῶς ἔστιν, πάντα γὰρ ἢ αἰσθητὰ τὰ ὄντα ἢ νοητὰ — all beings are graspable either by sensible perceiving or by νοεῖν, and insofar as every being is perceivable by the soul, the soul *is* in a certain way *all*: the *uncovering-being and possessing-being*, the *having* of all beings. Thomas takes this Aristotelian thesis not only for νόησις and αἴσθησις but in principle for *every* *virtus* of the soul: in the *anima* are the grasping power (*intellectus*) and the striving (*voluntas*) — *bonum est quod omnia appetunt* (the good is what all things strive for), and *convenientiam entis ad intellectum exprimit hoc nomen verum* (the name "true" expresses the accord of a being with the intellect). This is the ontological root Heidegger has been digging toward. *Verum* names the *convenientia*, the *accord*, of a being with the *intellect* — and this is possible only because the *soul* is the one being that "is in a way all things," that has, uncovers, and possesses every being. Truth is therefore a *being-together of two beings* (the being and the soul that accords with it), grounded in the Aristotelian thesis that the soul is potentially all beings. The medieval *adaequatio* (truth as accord of intellect and thing) is here exhibited in its ontological foundation, and behind it stands the Greek doctrine of αἴσθησις/νόησις as the *having of the world* that Part One won from Aristotle.

Verum, then, is a *modus essendi* such that the *ens* here considered *ad omnia* has the being-character of the *soul*; and being-true is a *way of being* in the sense of a determinate *being-together of two beings*. Heidegger stresses that only here, with *convenientia*, does a *concrete* being (the soul) get introduced — a being whose φύσις has the aptitude to *convenire cum omni ente* — so that the *verum* is brought onto the *background of fundamental being-determinations*. He pauses to lay out the connection that motivated the whole regress. How do *esse creatum* and *esse perceptum* hang together, and is there a base of ontological determinations from which both being-characters grow? The answer: both lead back to *esse verum*. He recapitulates the *falsum/error* chain (the *res cogitans* as *esse perceptum*; error as *privatio*, a *non esse entis* whose "non" is the *usus voluntatis non rectus, deficiens a rectitudine, a determinatione, a libertate, a natura humana, a natura creata, ab esse qua creatum* — so *falsum* equals *non esse creatum*, and *non falsum* equals *esse verum* equals *creatum esse*). The task is now discharged by clarifying how the *verum* is to be understood — and Thomas places the *verum* squarely within the *general question of the sense of ens and esse*.

Heidegger reconstructs Thomas's method once more. To come clear about the *verum*, one must first establish that it is a *quid*, a something; in every inquiry one must finally come to a *last*, for if the process ran to infinity, knowing as determining would be impossible — so all basic concepts are *resolved* toward a *last* concept. *Illud quod primo intellectus concipit quasi notissimum, et in quo omnes conceptiones resolvit, est ens*: the general determination into which every determination is resolved is the *ens*, the

being in a wholly formal and empty sense; *unde oportet quod omnes aliae conceptiones intellectus accipiantur ex additione ad ens* — every other conception is won by a determinate *additio* to this in-advance-given *ens*. But — and this is the crux — though *ōv*, being as such, is the most general determination of any possible being, it is *not* of the character of a *genus*: *ens non potest esse genus*. Because *ens* cannot be a genus, the directions of its concretion cannot run as *specifications*; rather, *secundum hoc aliqua dicuntur addere supra ens, inquantum expriment ipsius modum, qui nomine ipsius entis non exprimitur* — some things "add" to *ens* only insofar as they *express its mode*, a mode enclosed in being itself without being's expressing it. These determinations belong to the *being of the being as being*. Heidegger lingers on the thesis that *ens* is no *genus* because it bears directly on his own project: the "addition" to being is not the narrowing of a genus by differences but the *unfolding of being's own modes* (the transcendentals: *res, unum, aliquid, bonum, verum*) — a structure that already breaks the ordinary logic of genus and species, and that anticipates Heidegger's insistence that being is not a highest genus but must be questioned in its own modes. With *verum* located as the *convenientia entis ad intellectum*, the foundation of Descartes' *verum esse* — and thereby of *perceptum esse* and *creatum esse* — is laid bare: the truth that Descartes' criterion presupposes is the *accord of the being with the soul*, the scholastic-Aristotelian *modus entis* whose origin Descartes no longer commands.

§ 30. The proper being of the *verum* as *convenientia* in the intellectus (De veritate, qu. I, art. 1, 2, 3)

What is the *original* being of *verum*? Since *verum* is *convenientia*, accord, the question arises: is the *verum* the *convenire* itself, or does it have its proper being in the *anima* or in the *res* with which the soul accords? Thomas divides the sense of *verum* into three basic determinations: the *verum* is *founded in the res* with which the soul has accord; *id quod formaliter rationem veri perficit* — what *formally* makes up the perfection of being-true, *verum* equal to *rectitudo*; and *secundum effectum consequentem*, by which (so Hilary's definition) *verum est manifestativum et declarativum esse*, being-true as a *making-visible-being*, a *holding-a-being-in-the-clear*. The question is which of these is the *proper* being of the *verum* — and the way Thomas decides it, Heidegger says, is characteristic of the *transformation* Aristotle underwent within scholasticism.

Heidegger fixes the key term. Thomas uses several, non-identical expressions for the connection of every being to soul, spirit; *convenientia* is the most general, the *being-related*, the *mutual-reliance* of being upon being — and it must be held fast because it will show itself to be *double-meaning*, and this double meaning *first makes the whole approach possible*. The *convenientia* runs in two directions: it has a *determinatio toward the intellectus*, so that knowing must itself be determined with regard to the accord — this Thomas calls the *assimilatio intellectus ad rem*, the

intellect's making-itself-like the thing, to whose *natura* belongs the *proportio*, the being-borne-toward the matter, the having-grasped the *res* as *cognita*; and it is necessary *ut res intellectui correspondeat*, that the thing correspond to the intellect. Both ways of this mutual being-directed are gathered as *conformitas* — which the medieval Jewish-Arabic philosophy (in its Latin translations) named *adaequatio*, whence the formula *adaequatio rei et intellectus*. The *conformitas*, formally taken, is the *convenientia*. Heidegger has thereby exhibited the genesis of the classical formula *adaequatio rei et intellectus* (truth as the correspondence of thing and intellect) out of the Aristotelian *convenientia* — and signals that its *double meaning* (does truth lie in the accord, in the thing, or in the intellect?) is what allows the whole construction, and what *Sein und Zeit* §44 will pry open.

As *convenientia*, the *verum* has three relational moments: the *relation* itself, the *ratio formalis*, the *convenire*; the *fundamentum* from which a *convenire* is at all possible, the *res*; and the *cognitio* itself as the *effectus veritatis*. So the basic question becomes: with respect to *which* being is the *verum* the proper *modus* — *where is the verum at home?* Thomas decides it, as before, by a *formal* consideration: with respect to which of the three is *verum* said *per prius* and *per posterius* — where is it true in its *proper* sense, so that the rest can be called true only *per denominationem*? Negatively, the *res* is *not* the being that can be called true primarily; for, Thomas notes, what *first* receives the predication of a common term need not be taken as the *cause* of the others, but is rather *that in which the ratio of the common term is first found complete* — as *healthy* is said primarily of the *living being*, though we also call a medicine "healthy" as *effectiva sanitatis*. The thing *in which the sense of verum is completed* is properly true.

The connection between *res* and *intellectus* is carried out and actual in the *cognoscere*, and the *cognoscere* is a *motus cognitivae virtutis* going from the intellect (as *assimilatio ad rem*) and back; the proper *fulfillment* of a motion is where it *ends*. The motion of knowing goes from the knowing to the *known*, via the *res*, and *terminates in the known* — whereas the *motus appetitivae virtutis*, the willing being-out-for-something, terminates *ad rem*, in the thing done. (Heidegger notes Thomas's appeal to the Aristotelian *circulus* between the acts of the soul.) The *convenire* thus comes to its being *in the anima itself, in the intellectus*: the proper being of the *verum est in intellectu*. This is, Heidegger says, at first a *surprising* result — modern-spoken, the being of truth and of knowledge is put into the "*subject*." But the decisive correction follows at once: the proper being of the *verum* is in the intellect of *God, in intellectu Dei*, and God is the *ens perfectissimum*; the whole connection of the *convenientia* is seen purely "*objectively*" and *ontologically*. This is the pivotal misreading-guard of the entire Thomistic regress. That truth is "in the intellect" must *not* be heard, as the modern ear hears it, as a *subjectivizing* of truth (truth as a state of a knowing subject); for the intellect in which truth *primarily* is, is the *divine* intellect, and the doctrine is wholly

ontological — about the being of beings in relation to the creative knowing of God. The medieval *in intellectu* is the opposite of the modern lodging of truth in the human subject.

Heidegger develops the relation of the *res* to the *two* intellects. The thing is related differently to the *practical* and to the *speculative* intellect: the practical intellect *causes* things, hence is the *mensuratio rerum*, the measure of things; the speculative intellect, conversely, is *moved by* the thing (*res movet intellectum*). So relations of *measure* arise, in which intellect and thing can each be *mensurans* or *mensuratum*. The *res* itself is related to two intellects fundamentally: *secundum intellectum humanum* the *res* is the *mensurans* — the grasping cognition *measures itself* at the thing to be grasped; *secundum intellectum divinum* the *res* is the *mensurata*, the *artificiata* or *creata*, the *causata*. The *res naturalis* is thus *constituted between two intellects*, and *secundum adaequationem ad utrumque vera dicitur* — called true according to its adequation to *both*. The thing is *vera* insofar as it is as it is *ordained* (*ordinata*) by God's knowing; and this determinate, god-ordered being is what, of itself, merely *formats aestimationem*, furnishes the *measure*, for the human intellect. The *prima ratio veritatis* (according to the divine intellect) is *per prius* in the thing than the second, for the comparison to the divine intellect is *prior* to that to the human; even if the human intellect did *not* exist, things would still be called *true* in order to the divine intellect — but if *both* intellects were (impossibly) removed, *no ratio veritatis would remain*. So the proper being of the *verum* is *proprie in intellectu, inproprie in re; per prius* in relation to the divine intellect, *per posterius* in relation to the human. This is the architecture Descartes inherits. A thing is true *primarily* because it conforms to *God's creative* intellect (which produces and orders it into being), and *secondarily* because the human intellect measures itself by it — so the truth of a created thing *is* its being-as-God-made-it, i.e. its *creatum esse*. The equation *verum esse = creatum esse* that governed the Descartes-interpretation (§28) is here shown in its source.

What, then, at the being of *thinking* can properly be characterized as *verum*? The *convenientia* has its proper being *in intellectu*; but wherein does this consist? It must be a being-related in which *both* the *res* and the *intellectus* are relevant in their proper possibilities. And here Thomas makes a determination decisive for the whole tradition: the proper being of the *verum* is *not* in an *intuitus* upon the *quidditas rei* (a mere beholding of the thing's whatness), but the intellect is *true insofar as it is judging* (*urteilend*). Only as *componens et dividens* — σύνθεσις and διαίρεσις, combining and separating — does the intellect come to count, giving *something of its own*, whereas in the *intuitus* the intellect is merely *given over to the similitudo*. Only where the *res* is brought into relation to the *proper activity* of the intellect can one speak of *convenientia*; equality obtains only where the *diversa* are relevant in their being in their equalizing relation. Hence, Thomas says, *the ratio of truth is first found in the intellect where the*

intellect first begins to have something proper that the thing outside the soul does not have — and that is in the *judgment: quando incipit judicare de re apprehensa, tunc ipsum judicium intellectus est quoddam proprium*. Only thus is the proper *aequalitas diversorum* reached and the *convenientia* constituted. Heidegger draws the historical conclusion: this interpretation of the Aristotelian view that the being of ἀλήθεια is in the δίανοια shows the scholastic tendency to *independently ground* sentences that Aristotle simply *gives* (whose grounding lay in the connection of his research). Thomas wants to *uphold Aristotelian authority* and so erects a whole *theory of convenientia*. Two things matter here for the lecture. The location of truth *in the judgment* (the combining-and-separating intellect, not the simple intuiting of essence) is the scholastic root of the propositional concept of truth whose descent §21 traced — and Heidegger marks it as a *transformation* (and partial distortion) of Aristotle, who had located ἀλήθεια more broadly. And the method by which Thomas "independently grounds" Aristotle's ungrounded sentences is itself a symptom of the scholastic *building-over* (§20) that the *Destruktion* must reverse.

§ 31. In which sense the verum is in the intellectus (De veritate, qu. I, art. 9)

Far more important, Heidegger says, is article 9, where Thomas shows *that* and *how* the *verum* is in the intellect insofar as the intellect *itself knows the verum qua cognitum* — what Brentano called *inner consciousness*: that every *cogitatio* is at once a *knowing of itself*. This *reditus* into itself belongs, as a distinction, to the specific being of every being that is *spiritual* being; and the *reditus in se ipsum* was handed to the Middle Ages by the pseudo-Aristotelian *Liber de causis*. Insofar as the intellect is the being that *expressly co-grasps its grasped as such*, the being of the *verum* gets a peculiar *Aufgehobenheit*, a being-raised-up: it is not only *conscious* but *raised into self-consciousness* — though this is only the *continuation* of the *motus* from the *res* to the intellect and, in the intellect, to *itself*. Heidegger thereby exhibits the deep root of the Cartesian *cogito me cogitare* (§24) and of Husserl's *ego-cogito* (§5b): the self-presence of consciousness, its knowing-of-itself, is the medieval *reditus in se ipsum* of the spiritual substance, transmitted through the *Liber de causis* — so the modern "self-consciousness" is, in its being-structure, a scholastic-Neoplatonic inheritance.

He reminds the reader that the analysis is throughout after *being-characters*: with respect to Descartes, we interrogate the *res cogitans* for the *esse* that makes up the being of the *res* as such. From the analysis of *error* we saw that error is an *esse* in the sense of *non esse creatum*, so the *res cogitans* as *esse verum* is *identical with esse creatum*, and at once *esse perceptum*; these two basic determinations hang together in themselves, and their *foundation* is the *verum*. The whole movement points back: *all* being-determinations go back to *esse creatum*, and the view will open that the *ens verum* is founded in an *esse* whose basic determination is *esse creatum*, which in turn

points to an *esse increatum* (God). It is, Heidegger stresses, of *fundamental* significance that being-true is *not* oriented at *knowing and cognition-validity* but that the *verum* has the basic determination of a *modus entis*; the *verum* stands, for medieval ontology, on common ground with *unum, diversum, res, bonum, ens* — the determinations the Middle Ages calls the *transcendentia*, the *transcendentals*, because they lie *beyond every concrete being-determinateness* and for their part *determine every being*. (The *pulchrum*, the beautiful, is not so central and is mostly treated with the *bonum*, under Neoplatonic influence, Pseudo-Dionysius.) This is the decisive lesson of the regress for the lecture's whole argument against Husserl. *Truth is a transcendental, a mode of being convertible with being itself* — not a property of cognitions or a "validity." Descartes' *verum*, and behind it Husserl's truth-as-validity, are *degenerations* of this ontological concept; and Heidegger's own thesis (truth as a way of being, ἀλήθεια as un-concealment) is a *retrieval* of the transcendental sense against its propositional flattening.

Heidegger recapitulates the result so far: the *verum* is a *modus generalis entis in ordine ad aliud* in the sense of *convenientia*; and the closer consideration (through *correspondentia, assimilatio, conformitas*) showed that the *convenientia* is *related to the intellectus* and has its *terminus in being-known* — in being-known the proper being of the *verum* is enclosed. This reduction of the *convenientia* (which as such is a *relatio*, but one whose *weight* lies on *one side*) has its *ontological basis*: the properness of the *verum's* being is reduced to the *being of the intellectus*. The next question is therefore which *original* being grounds this properness: if *verum esse* is properly *in intellectu*, which being of the intellect is the *primo esse* from which both the *originariness* and the *last properness* of the *verum* are determinable? We go from the *proprie esse* back to the *primo esse* — and this leads to the *intellectus divinus*: God's being as *knowing-being* is the *original being of veritas*, such that from it are determined the *proper* being of the *verum* in the human and the *improper* being of the *verum* in the *res*. So from the original and proper being of the *verum* it first becomes intelligible *why and by what right* the *res* too is called *vera*; and the consideration leads back to the *esse Dei*, at which the last question stands: which is *God's* being, how is it categorially determined, and how is the being of truth *built into* it. The whole regress is thereby seen to be heading toward an *ontology of God* (§§32–33), because the ground of truth is the divine creative knowing.

The *positive* answer of article 9 (whether truth is in the senses) lets Thomas say more precisely how the *verum* is *in intellectu*. Truth is in the intellect, first, *as following upon the act of the intellect* (*consequens actum intellectus*); and second, *as known by the intellect* — for it follows the intellect's operation insofar as the *judgment* of the intellect is *about the thing as it is*, and it is *known* by the intellect insofar as the intellect *reflects upon its own act* (*reflectitur supra actum suum*). This *reflecti*, Heidegger stresses, is not

merely that the intellect *knows its act* (as an occurrence), but that it *knows the proportio of the act to the thing* (*proportionem ejus ad rem*): in the reflection on its act, the matter grasped as *true* by that act is co-given. And this reflecting can occur only if the intellect *grasps its own natura* — which can be known only if the *nature of the active principle* (the intellect itself) is known, *in whose nature it is to be conformed to things* (*in cujus natura est ut rebus conformetur*). This *natura* lies in the *conformitas*. Heidegger draws out the ontological point: the soul is *not* taken as a *transition* to which a "history happens" (a going-out to some being), but *to the nature of the intellect belongs the being-directed-toward things* — this *openness for beings* (*Aufgeschlossenheit*) is *not brought to it* but belongs to its very being. This is a recognizably proto-Heideggerian reading. The intellect's *conformitas*, its being-open-toward beings, is *not* a relation added between two present-things (a subject and an object) but a *constitution of its being* — the medieval anticipation of *Dasein's In-der-Welt-sein* and *Erschlossenheit* (disclosedness). Truth is seen by the intellect precisely in *reflecting on itself and bringing into view its own proportio ad rem*, and in so seeing, the truth is *aufgehoben*, taken up, into the intellect's being.

This becomes clearer at the *sense*: truth is in the sense too *as following upon its act* (the sense's judgment is about the thing *as it is*), *but not as known by the sense* — *if the sense judges truly about things, it does not yet know the truth by which it judges truly*. In sensory perceiving the perceived *is* there as true (the perceiving reaches its *terminus* and is, as perceiving-being, true), but the perceiving does *not* perceive *its own nature*, *nor the nature of its act*, *nor the act's proportio to things*. And here Thomas gives the great ontological gradation that Heidegger seizes: *those beings that are most perfect among beings, the substantiae intellectuales, return to their own essence with a complete return (reditio completa)*. The intellectual substances have a being that is *for itself*, that *returns to itself*, such that their being is co-determined by *being-knowing of something*; this *reditio completa* makes up their *perfection*, since through it all the being grasped by the intellect is *co-taken-up and appropriated*, and through this co-taking-up the being *increases in amplitudo*, in *extent of being*. Heidegger then dwells on the contrast with the *stone*: the stone *is* only in a determinate way — it does not even *have for itself* the being on which it lies; it is merely *with* it, *beside* it. By *knowing something posited outside themselves* (*cognoscunt aliquid extra se positum*), the intellectual beings *go out of themselves*; and the moment a being has the aptitude to *co-grasp its grasping*, to *return into the known* (*in cognitum redire*) — at the level of the *sensus* the *sentient thing begins to return* (and Heidegger inserts the striking parenthesis: *cf. Aristotle on ἡδονή* — *Befindlichkeit*, attunement). But at the sense the *reditio completa* is *lacking*, because the being of the *corpus* functionally co-belongs to the sense's going-out; these bodily moments *prevent* a proper *redire*, whereas the *substantia sciens* is not bound to *materia* but is *pure forma* — a being-mode with the *least coactatio*,

constraint, in itself, and therefore carrying the *wholeness of possible being*, the more so if this *forma* is the *ens absolutum* (God). So in *two respects* the properness of the *verum*'s being in the intellect is determined: that knowing-being is the *terminus* for the *convenientia*, and that knowing-being *knows itself*. Three things of the first importance are concentrated here. The *reditio completa*, the complete self-return of the intellectual substance, is the scholastic ontology of self-consciousness that grounds Descartes and Husserl. The contrast of the *stone* (which does not even "have" the being it lies beside) with the knowing being (which "goes out of itself" and so *increases* its being-extent) is the medieval anticipation of *Sein und Zeit*'s thesis that the stone is *weltlos*, worldless, while *Dasein* is *being-in-the-world* — and Heidegger's parenthetical alignment of Aristotle's *ἡδονή* (pleasure) with *Befindlichkeit* once more recovers the affective disclosure of Part One. And the gradation by *least constraint* (the purest *forma*, freest of *materia*, carries the wholeness of being) is the ontological hierarchy, crowned by God as *ens absolutum*, into which truth, self-consciousness, and Descartes' *res cogitans* are all set.

§ 32. The grounding of the proper being of the verum in the original truth of God (De veritate, qu. I, art. 4 and 8)

Wherein does the proper being of the *verum* originally ground — where is the *ens* that shapes the *proprie verum* into a *proprie verum primo* and so founds all being of the true? Thomas treats this in article 4, asking *utrum una tantum veritas sit, qua omnia vera sint*, whether there is only *one* truth from which all else is true; and he affirms it. The *verum* is *in intellectu divino proprie et primo, in intellectu humano proprie but secundario, in rebus improprie et secundario*. Being-true, as an *esse* in the human intellect, is a *derivatum* of the *prima veritas* whose proper and original being is in God. The truth said of things *in comparison to the human intellect* is *rebus quodammodo accidentalis* — things are indeed true with respect to the human intellect, but it does *not* belong to the being of the *res* to be grasped by a human intellect, so for them being-grasped and *verum esse* are *accidental*: the things would still be even if they were not objects of any knowing. But the truth said of them *in comparison to the divine intellect* is communicated to them *inseparably*, for *they cannot subsist except through the divine intellect producing them into being (non enim subsistere possunt nisi per intellectum divinum eas in esse producentem)*. The being of the divine intellect is a *posse producere*, a being-able-to-produce. So the sentence *omne ens est verum una veritate*, taken from its formal determination, means: *every esse, insofar as it is ens creatum, is verum*; the foundation for the being-determination given in the *verum* lies in this, that *being as being is in advance determined as esse creatum*. The question of the *esse* of the *verum* leads back to the *esse creatum*, so that the being of the *verum* becomes intelligible from the being of the *ens creatum*. This is the culmination of the regress and the deepest ground of the whole Cartesian construction. Truth is *primarily*

in the *divine, productive* intellect, which produces things into being; a thing is true because it is as God's creative knowing makes it; therefore *to be is to be created, and to be created is to be true* — *esse, ens creatum, verum* coincide at the root, in God's *posse producere*. Descartes' *verum esse = creatum esse* (§28) is now grounded to the bottom.

Heidegger draws the methodological lesson for the lecture. The connection of Thomistic with Aristotelian ontology cannot be treated here; it is enough, with respect to the content-wise *wholly different* sphere of phenomena that *consciousness* represents, to show that *this region is determined by an ontology whose categories and prefigured possibilities of determining and questioning have a wholly other origin*. This is the entire point of the regress: the modern field of "consciousness" is determined, in its very being, by an ontology (the scholastic-Aristotelian doctrine of *verum esse* as *creatum esse*) that arose for a *wholly different* domain (created nature, God), so that consciousness is interrogated with categories foreign to it — the *uprooting* the *Destruktion* exposes.

He restates the architecture. The connection that makes the *verum ens* a theme of fundamental inquiry is the one named by the title *transcendentia*; the proper being to which the *verum* is ascribed as *modus* is the *esse in intellectu componente et dividente*, whose being is characterized by the *reditio in se ipsum*; and the *primo esse* in the sense of the *proprie esse* is the *esse in intellectu divino*. Article 4 shows that this *one* truth is there; article 8 shows that this *una veritas* is that from which *all* truths — even those of *negationes* and *privationes* — are derived. The result of article 4: the truth that can be ascribed to the *res* such that it belongs to them *inseparably* (the *res qua res qua* subsisting) is reduced to the *intellectus divinus quasi ad causam*, to the human *quasi ad effectum*, insofar as the intellect *receives its science from things*. The human intellect has a *wholly different* relation to the *convenientia* and the *res* than the divine — yet *both* relations are called *convenientia*: with respect to the divine intellect the divine is *cause*, the human *effect*. Taking truth in the proper, original sense from the being of the *verum* in God, *omnia vera* — all that is, is true with respect to God's *one* being. With respect to the *verum esse secundario et proprie*, that is, to the human intellect, there are *several* truths, a manifold of true propositions corresponding to a manifold of truths that can be drawn from things; but with respect to God each *res* is *only one veritas*, since its being-true grounds in its being related to the divine intellect. The truth said of the *res itself* is, though with respect to God, accrued to this *res in its forma*; that it is *so* says it is *true*; the *res* has in itself, insofar as it is, a *qualitas* on the ground of which the *aptitude to the adaequatio intellectus ad rem* takes place.

So Thomas wins, with respect to all that is, a fundamental truth-concept that ultimately *falls back on the relation of causare and causari in the sense of producing, forming*

making — the *what* thought and created by such an intellect is true being in the original sense. The supplementary consideration (article 8) shows that *not only the res but also the intellectus depends, by derivatio, on the one truth* and is subordinated to the *regio of the res*: the intellect has its priority only *within the creata*; with respect to the *una veritas* it *loses* it. Each thing's look, its essence, is nothing but the *imitation of the ars*, the productive art, of God's creating consciousness; the essence *per formam*, by which a *res* is what it is and as such true, *is born to make a true apprehension of itself in the human intellect (nata est facere de se veram apprehensionem in intellectu humano)* — being-so-constituted is the *fundamentum* for a *vera perceptio*, and every *apprehensio* that follows the *lumen naturale* is in itself the grasping of *true being*. Hence the *veritas rerum* includes *entitas*: things are true only insofar as they *include entity in their ratio*; and to this *entitas* truth *superadds the habitudo adaequationis*, the disposition of accord. Since the *res* is created, it is by this very created-being placed into a *being-relation* to God and to a possible intellect, to which it *adaequates* — and in *adaequare* (*convenientia, convenire*) lies the *double meaning*: *adaequatio ad intellectum humanum* and *adaequatio ad intellectum divinum*, where the sense of *adaequare* is each time different. The whole truth-concept is thus referred to *productive making*: the true being is the *what* that God's creative intellect (the divine *ars*) has thought and produced, and the thing's essence is the *imitation* of this divine making — so that truth is grounded in *creation as production*, a making-ontology (the οὐσία-as-*Hergestelltsein*, being-produced, that Heidegger tracks from the Greeks) raised to the absolute.

Heidegger treats the case of *negatio* and *privatio* (where one can really establish, say, a *crime* or a *blindness*) to show its limit. Privations *have no forma*, are negatively determined, and so have *no direct relation to God*; a *privatio* is not an *entitas*. When set in relation to an intellect and so made a *truth*, it is *grasped* but not posited *as being* (as *entitas*): *lapis verus et caecitas vera* — a true stone and a true blindness — but *non eodem modo veritas se habet ad utrumque*, truth does not stand the same way to both. The truth of the stone has its *fundamentum ex parte ipsius rei*, in the thing itself: in the stone's whatness lies the ground on which it can be related to a grasping intellect, so the motivation passes *from the thing-content itself* to the intellect, the *correspondentia* grounded in the stone's whatness. But *blindness* has no positive thing-content that motivates the grasping; in "*vera caecitas*" the *vera* is *not* a moment of *privative* being — the *verum* with respect to a privation is *not itself a privation*. Such a truth has its truth-character *not* from the thing-content of what it is true about; there is merely a *relatedness* of the being-blind to the intellect, and the truth of asserting the actual presence of a blindness has its *fundamentum not in the privatio as such* but in the *intellect*. Hence, *patet ergo quod veritas in rebus creatis inventa nihil aliud potest comprehendere quam entitatem rei, et adaequationem ad intellectum, et adaequationem intellectus ad res vel privationes rerum* — the truth found in created

things comprehends nothing but the entity of the thing, the adequation of the thing to the intellect, and the adequation of the intellect to things or to privations of things. The truth concerning a *privation* has its proper being in the *being of the intellect*: the intellect, as grasping what is, is itself *true*, directed at its *bonum*, which is the *verum*; and as a *limited bonum* the intellect is itself *caused by God*. Heidegger notes the *entanglement* here, easily made accessible only if one *completely excludes every modern view*: intellect and *res* are set into the *unitary region of the ens creatum*, and so *knowing is taken as an objective being-relation within this esse creatum*. This is the decisive verdict of the whole regress. In scholasticism *knowing is an objective relation between two created beings* (intellect and thing), both measured by God's creative knowing — and this conception, *self-evident* to those who live in it and contemptuous of any modern reading, gains thereby a *security* unmatched by other theories of cognition; *but* knowing-being thereby *loses its original sense*, being *modified to the neutral being-sense of a movement from one being to another*, and this *leveling onto the ens creatum* is what allows the whole connection to be grasped as a *formal ordering of the convenientia into the modi generales*. The price of scholastic security is the *leveling of knowing* into a neutral being-relation within created being — the very leveling that, inherited by Descartes (§26) and Husserl, hides the being of *Dasein* and its *Erschlossenheit*, and that Heidegger's analysis of knowing as a comportment of being-in-the-world means to undo.

§ 33. The determinabilities of God's being in the line of sight of Aristotelian ontology (Summa theologica I, qu. II and III)

How, then, is the whole *region of the ens creatum* — in which both the totality of the *res* and the *intellectus qua res* lie — itself determined? We gain the insight into its basic determinations, Heidegger says, by relating it to an *ens increatum*, the *esse Dei*: from the positing of God's basic being-character, the mode of the *ens creatum* (as a being *derived* from the original being) is co-determined. He takes up the question of God's being where it is a matter of *proving God's being-there* — not the proofs themselves, but the question *which being of God is in advance posited* in the task of proving God's existence, *from which being I take the ground* for grounding God's being-there.

And here Heidegger uncovers the decisive reversal. Looking closely, it shows that God's *being-there is not so much the source from which the being of the ens creatum is determined*; rather, *conversely, from a determinate pre-conception of the being of the created, God's being itself is determined* — so that the apparently *original* being (God) is only *derived* from the *esse creatum* by a quite determinate *method*. This is the proper ground of what one later calls *negative theology*: a *remotio* of those being-characters incompatible with the idea of an *ens absolutum*. But even a *remotio* must have a *positive idea* of an *ens absolutum* hovering before it, to have any criterion for which

characters must be removed; and the idea of God is oriented at the *simplicitas Dei* — God taken in advance as an *ens simplex*, so that the *remotio* is precisely the exclusion of all *compositio* from the being-determinations of the *world's* accessible being. This already shows, Heidegger notes, that the *accessible being of the world is taken in the sense of producing, forming: compositio is compositio ex materia et forma*, so it matters to exclude every *materia* (by which every being is *limited*), and the first article of question III asks whether God is a *body* (*Utrum Deus sit corpus*) — answered negatively, since in God the very possibility of a *compositio* is lacking, and only *actus purus* remains as the *essentia Dei*. The reversal is one of the most important results of the lecture. The "proof" of God does not derive the world from God; it *constructs* God by *removing* from the world's (created, producible) being everything incompatible with simple, pure actuality — so the *ens absolutum* is a *function* of a prior conception of *created, producible* being. God is determined *from* the creature, not the creature from God.

Heidegger reminds the reader that in determining *verum esse* as a *modus essendi*, the *esse* is grasped as *esse creatum*, and the *modus essendi* of the *verum* is prefigured by the *esse creatum* being the *object of the divine intellect* — since every being measures itself to this intellect, every *esse* is *verum*; and only by the *formalizing* of this concrete being-connection with respect to the *verum* did Thomas's whole questioning become possible. He notes that Greek philosophy too says that ἔν, καλόν, ἀγαθόν are determinations accruing to being as such, in a reversible relation, *but* that in Aristotle *no deductio is carried out* — a hint that the scholastic *system* of transcendentals and the *deductive* derivation of God are themselves a building-over of the Greek beginning.

Led back to God's being, Heidegger considers it *not* theologically but only to read off *from which ground* God's being is determined, insofar as God is grasped as *causa efficiens, ens creans*. For God's being to be exhibited, the exhibition needs a *ground*; the *being of the world*, on which the proof proceeds, must be *loosened and articulated*; and the question is *which background of being "commonly" bears, ontologically, God's being, the world's being, and God's being-toward-the-world*. He runs through the *five ways* of *Summa theologiae* I, q. 2, a. 3 (*Utrum Deus sit*) not for the proofs but for the *being-characters of the starting being* that function as *fundamentum*. Each of the five takes the world's being in a determinate respect and reaches God by *remotio*: God as the *primum ens immobile movens* (the world taken as *res* in which a *moveri*, motion in the wide sense of μεταβολή, shows — Aristotle's *Physics* VIII, πρῶτον κινουῦν ἀκίνητον); as the *causa efficiens prima* (the world as a connection of *causae efficientes*, ποιεῖν-πάσχειν, of effect-connections, being as *effecting*); as the *esse necessarium per se, non ab alio* (the world as a being that can be so and otherwise, whose possibility in various directions demands a last necessity); as the *maxime ens, summum ens* (the world offering itself in *degrees* of being, each being what it is in an *appropinquatio ad*

aliquid quod maxime est, an approach toward a maximum, a limit-value); and as requiring a *gubernatio rerum propter finem* (things oriented to an *end*, a *finis* as the properness of their being, toward which each tends).

Heidegger then makes the stroke that gathers the whole regress back to Part One. Greek-spoken, this being, insofar as it is the *ground* for the proof of God, is *κινούμενον, ποιούμενον, μεταβλητικόν, καλόν, τέλειον* — moved, produced, changeable, beautiful, complete; and *in these characters the essential categories become clearly graspable in which Greek ontology sees the πράγματα, the things of nearest dealing, as they are to hand (zur Hand)*. This is a decisive recognition. The five ways take the world precisely as the world of *concernful dealing* — the *πράγματα*, the *ready-to-hand (zur Hand)* things of §2 and §3 — so that the proof of God, and with it the whole ontology of *ens creatum*, rests on the being of the *handled, used, produced things* of everyday dealing, raised to categories. The being of God is reached from the being of *equipment*; and the *Zuhandenheit* (readiness-to-hand) that *Sein und Zeit* §15 will thematize is here named as the hidden ground of scholastic theology.

That this Greek-categorical being is in fact the ground from which God's being is determined shows clearly, Heidegger continues, in question III, on *what God is*. Thomas is oriented at God as an *ens simplex* excluding every *compositio*, and question III constantly *refers back* to question II (God's being already fixed in the five characters). Article 1 (*Utrum Deus sit corpus*) is answered negatively, with appeal to the patristic disputes with Gnostics and Manichees (for the Middle Ages more or less obsolete). Article 2 (*Utrum in Deo sit compositio formae et materiae*): God, as *primum movens actus purus, maxime ens primum bonum*, can contain no *materia* and lacks all *compositio* — and here Heidegger marks an *essential transformation* of Aristotelian ontology: *forma* itself is won as a *mode of being*, as *being* and as *constituting being* (a regression toward Plato). The objection that *materia est principium individuationis* (things get their determinate look insofar as *forma* is limited by *materia*, and since God seems to be an *individuum* — *non de multis praedicatur* — he would be composed of matter and form) reveals the medieval sense of the category *individuum*: *individuum* seen at *predication, non de multis praedicatur*, a concept grown in the *formal-ontological* orientation and leading back to Greek ontology. Thomas answers that the principle of individuation in God is not *materia* but the specific being as *forma* (a form that cannot be received into a matter), so that *materia* is the principle of individuation only *negatively* and cannot be relevant to God's being. Article 3 contains the essential thesis that in God *essentia* and *esse* (essence and being-there) are *identical* — necessary, since no real differences can be made in God; and this proof rests entirely on orienting the *essentia* at the *ορισμός*: in the human *essentia* (*humanitas*) not all the determinations of a concrete human being are taken up (*non est totaliter idem homo et humanitas; humanitas* is the *pars formalis hominis*), whereas in

God *homo* and *humanitas*, *Deus* and *Deitas*, are identical — *oportet quod Deus sit sua Deitas, sua vita*: God is, in his being, his *life* (whence the wealth of *De ente et essentia* treatises). The further articles (God in no *genus*; the summary *Deus nullo modo compositus sed omnino simplex*) confirm the orientation. Heidegger does not pursue the *quaestio* for its own sake; his point is that every determination of God (simplicity, *actus purus*, the identity of essence and being, the exclusion of matter) is reached by removing from the inherited Greek-categorical being of the *world* (the produced, composite, moved πράγματα) — so that God is the world's being *minus its limits*, a construction governed throughout by the ontology of the ready-to-hand.

Heidegger states the conclusion of the whole second Part. For us it has resulted that the *verum* is being-wise oriented at the *esse creatum*; that the *esse creatum* is itself categorially seen in the basic categories Greek ontology developed in Aristotle; so that *in advance no original question is posed at all*, but God is in advance seen in the *line of sight* and the *determinabilities of being* given by the *handed-down ontology* and by a determinate interpretation of the *world's* being. These basic determinations are the ones that determine the *ens creatum* in the widest sense; and *within* this so-determined being, the *being of the human* too must be seen, and from it the *natura hominis* and the *perfectio* of this nature. So *from this ontology the specific being of knowing is predetermined, the being of the care of knowing — and at once predetermined, since the verum is what cognition is after, is that toward which the care goes*. This answers the *third* of Part Two's three questions and completes the regress. The whole apparatus through which Descartes determines consciousness — *verum, esse creatum, intellectus, voluntas, perfectio, error* — is *predetermined* by an inherited, Greek-categorical, theological ontology that no original question has tested; so the care for known knowledge does not freely encounter its field but finds it already cut to the measure of *created, producible, true being*. With this the regress behind Descartes to scholastic ontology is complete, and the way is open to show, in the chapters to come, how this inherited determination of *verum esse* is, in Descartes, *converted into certum* — how truth becomes certainty.

Chapter Five: The care of cognition in Descartes

Heidegger now turns to see how, in Descartes, the care of cognition is prefigured and determined in a quite definite way — *how* and *what* it discloses, as actually existing, in which being-characters.

§ 34. Descartes' determination of the being of knowing as judging in the horizon of being as creatum esse

The transformation that Greek ontology and its determinate questions underwent through the Middle Ages cannot be shown here, Heidegger says; that would require considering the whole sphere of influence of the theological questioning upon philosophy. With the two interpretations (Descartes and Thomas) the foundation for the further discussion is created, under the reservation that for a *radical* inquiry the interpretation of *Aristotelian* philosophy would become decisive. Heidegger gathers two results. First, by exhibiting the being-sense of the *verum*, *what the care of cognition goes for* is determined: the care has placed the *true* into its care, the grasping and following of truth, and since the *verum* has been discussed as to its *esse*, that toward which the care goes is fixed in its being-sense. Second, since the being of knowing is a *cogitatio*, and the *cogitationes* fall into the region of the *res cogitans*, and the *res cogitans* is determined as an *esse perceptum* (the *perceptum* being *res percepta*, the *res percepta* grasped as *verum*, and the *verum* seen on its ground), the being-character of the *cogitatio* in the sense of knowing determines itself fundamentally as *creatum esse* and belongs, as this *creatum esse*, into the *res cogitans* — and the *res cogitans* makes up *the being of the human*, so that with the determination of its being-character *the being of the human is predetermined*. The whole regress is thereby brought to bear: *knowing*, as a *cogitatio*, has the being-character *creatum esse* (= *verum esse*), and since the *res cogitans* is the being of the human, the human's being is settled in advance as *created being*.

The question is now how Descartes more closely determines the being of *cognitio* from this horizon, and *why* knowing is grasped, in this stress, as *judgment* (*judicare*). Heidegger reconstructs the derivation. The being of the human is a *perfectum esse*, but such that in it *errare* is given and the *verum* is only a *medium esse*; so to develop the human's perfection requires the *overcoming of error* — the human's being must become *error-free*, and knowing, to be perfect, must place itself under a determinate *regulation*. With this *Regelnahme*, rule-taking, *the care-character of knowing first clearly comes to expression*. Being-caring as *truth-following*, in the sense of holding-oneself under this rule, prefigures the ways of its formation: knowing must be carried out as *continere* and *abstinere*, holding-in and abstaining — and this holding-in-and-abstaining is the specific being-mode of *dubitare*. The *dubitare* takes the way through the possible ways of grasping until it strikes upon something *indubitable*, something that by its being satisfies the sense of the *rule*. So *doubt* is not skepticism but the *enactment-form of the care for known knowledge*: the methodical abstaining-from-assent that seeks an unshakable ground — the care of *security* (§22) in action.

Heidegger then poses the question that governs the whole rest of the lecture. In which sense is the care of cognition, in the enactment-mode of *judicare*, *disclosing*? *Does the judicare disclose anything at all, or does it only make visible what is already secured*? And he answers programmatically: insofar as it shows itself that the care of cognition is

only apparently disclosing, that it *only makes explicit an in-advance-secured*, the *decisive breakthrough* opens onto the specific being of the care in the sense of *Beruhigung* — tranquilizing, reassurance — into which basic phenomenon *all* the characters of the care are taken back. This is the hinge between Part Two and Part Three. The Cartesian method does *not* genuinely *uncover* its field; it only makes explicit what the care for certainty has *already* secured (consciousness as the indubitable *res cogitans*) — and this reveals the deepest character of the care: *Beruhigung*, the tranquilizing self-reassurance that seeks rest in the unshakable, the existential ancestor of *Sein und Zeit*'s "tranquillized" (*beruhigt*) everydayness and of the flight from anxiety. The whole apparatus of doubt and clear-and-distinct perception is, at bottom, a *seeking of rest*.

The being of the care of cognition thereby *opens the view onto the way of being of life*: the exhibited being-characters of the care are determinate *ways of Dasein's being*. So it must now be exhibited *what Dasein itself means*, what basic character of *Dasein* expresses itself in the *Da*, the there — and a phenomenon of *Dasein* will show itself as *Entdecktheit*, uncoveredness: *Entdecktheit is a basic character of the Da and determines the peculiar being of Dasein in the sense of being-in-a-world*. In view of these basic phenomena we will be put in a position to discuss the *verum*, the phenomenon that constantly accompanies us, on its peculiar sense, and to see how, through the determinate being of the *historical* that we ourselves are and bear, this explication of being onto the *ἀληθές* has *shifted*, by completely *covering itself* and *dissolving into a general objective being-produced* (*Hergestelltsein*). On this way we win what stands in advance in the task of the lecture: *not to criticize but to disclose positive phenomena from concrete considerations*. The question is which being-character consciousness has and from which care it springs, and whether this care of cognition has a claim to *radicality* or whether rather the *regress to the theme "Dasein"* first tries to make the possibilities of phenomenological research effective — at which point arises the methodical reflection on *by what right* we interrogated phenomenology for the being-character of its theme. (Heidegger again enters the reservation that the correspondingly radical discussion of the being-foundation cannot be carried out, because Greek ontology cannot here be interpreted.) The trajectory of the whole course is thus made explicit. The Descartes-interpretation issues in the concept of *Beruhigung*; *Beruhigung* points back to the *being of life, of Dasein*; and the analysis of *Dasein* requires the phenomenon of *Entdecktheit* (uncoveredness, the existential of being-in-the-world), against which the *verum* can finally be re-discussed and the *ἀληθές* (truth as un-concealment) recovered from its historical covering — its dissolution into "objective being-produced." The "first step of distancing" from *ἀληθές*, taken by Descartes, is to be reversed by the regress to *Dasein*.

Heidegger then carries out the derivation of *judicium* through the *ens medium*. On the being-ground of *creare*, Descartes says he *perceives the idea not only of God, or of the supremely perfect being, as real and positive, but at once the idea of nothing, or of that which is supremely removed from all perfection*. I see this double being — the *ens summe perfectum* and the *nihil* — insofar as I grasp *myself as something*: this is the naked, specific basic experience itself — as *something* I am *not nothing*, and I have the *nihil* co-given, which I am *not*. I experience myself as *something*, but not as God, the *summe perfectum*; I grasp myself as an *ens medium*, *placed between God and nothing* — and this being-placed of my being is as *determinate* as the being between which I am placed. I am also a *perfectum*, but a *medium perfectum*, an *ens creatum* and as such *perfectum*, though not necessarily a *summe perfectum*; a *factum*, made up to a determinate end of itself. Descartes determines this *ens medium* more closely by researching himself — the *res* that is *something*, not nothing, not God — on its possibilities, and finds that the *cogitatio in the sense of the voluntas* is the being-possibility in which the *proper* being-possibility *breaks through*: the being-determination of the *ens medium* by reason of which "*I understand myself to bear a certain image and likeness of God*." The *medium ens* determines itself such that what is properly *perfect* is the being-mode in the sense of the *voluntas*; and what makes up the *voluntas* in its proper being is the *determinatio*, the *determinatio in bonum*. So the proper *medium ens* is the *voluntas* — *perfectum*, but as *medium* not *summe perfectum*, so that this determinate being has a *possibility* with a view to absolute perfection. This is the metaphysical anthropology underlying the theory of judgment. The human is the *in-between* being, set between God and nothing, whose highest possibility (the likeness to God) is the *will as determinatio in bonum* — so the human reaches toward absolute perfection precisely through the *right use of the will*, which §27–28 located in the assent to the clearly-and-distinctly perceived.

And from this the determination of knowing as *judgment* follows necessarily. Since Descartes puts *cognition* in view and sees the human's being so, he must determine the being of knowing — hence the being of the human — *fundamentally as judicium*; for only then is the human's being being-wise *related to the summa perfectio*, insofar as the *judicium* represents a *modus volendi*, a mode of willing: *judicium is equal to assensionem praeberere*, to grant assent. Why the sense of *truth-following* is directed at the *assecutio veritatis*, the attainment of truth, lies in the *same* moment as the determination of the human's being by his properness in the *voluntas*; and with this all the enactment-modes of knowing — *abstinere* and *continere* — are determined in the *same* being-character, and the way is prefigured in which, through the enactment of a rightly-led being-knowing, the *non errare* is reached. The appropriation and formation of a *habitus non errandi*, a habit of not-erring, must therefore be carried out in *constant* view of what the *rule* prescribes as to be followed. This completes the derivation of the

central Cartesian thesis. *Knowing is judging because the human's perfection lies in the will, and judgment is a mode of willing (assent)* — so cognition is not a beholding of the true but a *willed assent* to it, and the whole task of method becomes the formation of a *habit of not-erring* by holding the will under a rule. The propositional, judgmental concept of truth is thereby grounded in the *voluntarist* anthropology of the *ens medium*.

Heidegger flags the consequence for the history of truth. Through the interpretation of knowing as *judicium*, the *verum* moves into a determinate place and comes into the *nearness of what one today grasps, in the sense of validity (Gelten), as a certain being* — and *with this the first step of the distancing from the real sense of the ἀληθές is taken*. He closes the section methodologically: such a working-into research cannot proceed by general argumentation but only by carrying out the steps *from the understanding of the matters themselves*, so that a real appropriation of the matters is guaranteed.

§ 35. Rule-taking of judging: *clara et distincta perceptio* as the general rule of knowing

The interpretation, Heidegger says, runs in determinate steps: from which line of sight Descartes is led to a particular grasp of knowing as *judicium*, and how this determination is led into the basic determinations of the being of the human. This so-determined knowing has, for itself, a determinate possibility of its enactment prefigured: through the basic determination of the being of knowing as *judicare*, this *judicare* must place itself under a rule *set by it itself*, and the interpretation of the rule yields a further-reaching insight into the being-character of knowing as a *care*. This knowing carries itself out in the manner of *dubitare*, with the aim of securing a ground that satisfies the claim of knowing, and the so-secured knowing comes to the disclosing of a determinate being-domain — that which has become thematic as *consciousness*. Heidegger thus keeps in view that the rule (and the doubt that applies it) is the means by which the care *secures* a ground and thereby *discloses* its field — the question of §34 (does it disclose or only make explicit?) remaining open.

He carries out the interpretation of the rule-taking: what the rule is, whence it springs, what it encloses. Descartes counts the *idea of freedom* and being-free among the experiences given with the *sum res cogitans*: we are so conscious of the freedom and *indifference* in us that there is nothing we comprehend more *evidently* and *perfectly*. Heidegger notes the slippage: here, in determining *libertas*, Descartes again brings in the very freedom-concept he had properly *rejected* — *libertas et indifferentia* (§27). He adds a biographical-polemical aside: Descartes was concerned to introduce his philosophy into the *Jesuit colleges*, sought a suitable textbook he need only copy in order to smuggle himself into the Jesuit course of instruction, so that the *Principia* is a writing led by determinate tendencies, on the other hand clearly and *schoolishly* built for

school-use. Knowing, then, must be grasped as a *cogitatio* that is a *modus volendi*, and this forces the characterization of knowing as *judicium*; the *judicium* is characterized by the *assensus*, the assent to what is held before the *voluntas* by the *perceptio*. This so-grasped knowing is a being-mode within the being of the human, which is at the same time in the *possibility of erring*; and if the human is to win his proper being, it must matter to him to carry out the being of knowing such that he *avoids error* — there must be such an inclination and security that, where a *non liquet* ("it is not clear") is given, the judgment *abstains* from the *assensus*. So the *habitus* determines itself more closely as a *continere* and *abstinere*, a holding-back from assent. The rule is thereby located in the care for not-erring: it is the *discipline of withholding assent* where clarity is lacking, the methodical core of the *habitus non errandi*.

In the idea of the *perfectio* the necessity is prefigured that what is to be given for the judgment be given in a *quite determinate way*; the question arises in which way the being grasped in the *perceptio* must *present itself* so that the judgment can be carried out as a *grounded* judgment — in which way the *verum* must *show itself* so that the *assensus* is one that represents a *determinatio in bonum*. The grasping and presentation of the true must come under a *determinate guidance*, in the sense that the guidance *shows the true as such* to be assented to; the true must show itself such that *in itself* it becomes *decidable* whether it can rightly obtain the assent or not. The guidance, in the sense of a *regulation*, must at the same time be the *criterion* by which the enactment and non-enactment of the assent can be decided; the rule that guides the assent as a criterion must contain in itself the *prefiguring of how the truth should and must encounter* so that it can receive assent. Heidegger fixes the threefold task of examining this rule: the *encounter-mode of the verum* itself — with regard to its *origin*, and with regard to the *idea of truth-grasping* from which the rule gains its legitimacy, and how this demanded encounter-mode is placed *into the rule*; the manner in which the rule is *taken as rule*, in which a quite determinate *care* expresses itself; and how the *verum encounters* in the rule-taking. The structure of the analysis keeps everything referred to the *care*: the rule is not a neutral logical criterion but the form in which the care for security prescribes *in advance* how truth must show itself to be admitted.

The rule under which Descartes places knowing is the *clara et distincta perceptio*. Heidegger examines *perceptio* and *clare et distincte*. *Perceptio* Descartes uses largely like *apprehendo*, *deprehendo*, *animadverto*: to perceive something *as it is in itself*. In the *Principia* he distinguishes two *modi*: the *modus percipiendi* and the *modus volendi*; under the first he counts *sentire*, *imaginari*, *intelligere* — *perceptio* here in a wider sense, including *αἴσθησις* and *pure νοεῖν* — and it is the latter, the *pure intelligere*, that is meant in the *regula generalis*. In the wider meaning, *percipere* spans those *modi* that do *not* have the character of *volitio* (while the *modi volitionis* are *cupere*, *adversari*, *affirmare*, *negare*, *dubitare*). For a *perceptio* that is to be sure enough that a judgment

can rightly be grounded on it, it is demanded not only that it be a *clara* but at once a *distincta* perceptio; through these two respects it is prefigured *in which sense the verum has to encounter*.

Heidegger then analyzes *claritas* through the moments that come into question as characters of the *verum*'s encountering. The *perceptum* is such that it is grasped by an *expressly directed* grasping, by a *mens attendens*, an attending mind that lives in the tendency to *grip* what is to be grasped as it is in itself — for there are also *perceptiones* that show a certain presence, give an existing thing, but in which the express directedness-at-grasping can be lacking. The *perceptum* must be *present* (*praesens*) for this so-characterized grasping: the being to be grasped may *not* be given in the manner of being-*remembered* — I can remember something, and the remembered can be given clearly and even distinctly in the memory, but memory does not have the aptitude to give the being as a *praesens*; nor does a mere *representing* of something. The *perceptum* must be there as a *res aperta*, openly lying there, the being as it is in itself, in no way covered, not given indirectly. And the so-present-and-open must be perceived such that it has the possibility *satis fortiter movere*, to move sufficiently strongly, the grasping directed at it — the grasped must be so present and open that it *fetters* the grasping *percipere* to itself. These four moments (the attending mind, presence, openness, the strength to fetter the gaze) characterize the *perceptio* as a *clara*. To be a *distincta*, the *perceptio* must itself be clear; the *distinctum* consists in the *perceptio*'s being *sejuncta et praecisa* against other *perceptiones*, so that the whole compass of the clearness of the *perceptio* is *secured* — the *distinctum* is the specific moment of the corresponding clear *delimitation* of the clear itself. There are clear *perceptiones* not necessarily distinct, but no distinct ones that are not clear, since distinctness is a moment *founded in clarity*.

Heidegger dwells on Descartes' example of *pain*, which "gives a reference for the specific *narrowness* grounded in this criterion." One who feels a great pain has the pain, as existing, *absolutely clearly*, but not always *distinctly*; it mostly happens that people *confuse* the clearly-felt pain with a *dark judgment* about what is in a certain way co-given — when we say the pain *bores in the tooth, tears in the leg*. Here the pain is given absolutely clearly but *not distinctly*: I *localize* the pain *in the tooth*, while it yet *concerns the res cogitans* — "*while precisely phenomenally the pain is given only in the tooth*." This last clause is a quiet but pointed objection. Descartes' criterion *re-locates* the pain (clearly felt "in the tooth") into the *res cogitans*, declaring the felt localization a "dark judgment"; but *phenomenally* the pain *is* given in the tooth — so the criterion of clear-and-distinct perception, by demanding that everything be referred to the *res cogitans*, already *covers over* the phenomenon (the lived, embodied, worldly givenness of pain) in the name of distinctness. The "narrowness" of the criterion is that it cannot let

the phenomenon show itself as it shows itself — a small but exact instance of the *φαινόμενον* being lost.

Heidegger closes the section by binding the rule back to freedom and care. This being of cognition as *judicium* is *the being-free of the human insofar as he is as a knower*; being-free is *propensio in bonum*, a being in the *possibility of errare*, and it needs a *guidance* so that it holds back everywhere there is no legitimacy for it. This guidance must be so given to the being of knowing that it accomplishes the fundamental thing — to *pre-give the assent the ground* to which it assents, and to pre-give it such that the assent is *assentingly clear about itself that it rightly assents*. The rule that is to regulate the pre-giving of the *fundamentum* for the *judicare* must consist in *securing the encounter-mode of the verum* for the *judicare*, and securing it such that it becomes *decidable* whether the *judicare* should *assent or abstain*. The rule is thereby fully located within the care: it is the will's self-given criterion for *responsible assent*, the form in which the care for not-erring (for *security*) makes truth's self-showing decidable — and the question whether such a rule *discloses* a field or only *secures* a foregone one remains, pressing toward the verdict of §§37–38.

§ 36. Origin of clarity and distinctness. Descartes' idea of science and the *Regulae ad directionem ingenii*

What *origin* have these determining characters of *clarity* and *distinctness* — whence does Descartes take the *right* to *prejudge* what is posited in the *regula generalis* for every possible cognition that may arise? If one looks at the rule purely as to its *content*, Heidegger observes, it is at first not visible at all in which sense this rule and what it says should be related to a *determinate object-domain*: nothing is said in the rule about the specific *object-character* of what is to be grasped in it, nor can it be established from the content which specific *grasping-relation* is meant — whether this *percipere* is oriented at a determinate kind of *access to and dealing with* beings, insofar as in knowing they are objective. The sense of the *relatedness* of the *percipere* is a *purely formal, indeterminately general* one. This is the decisive observation. The criterion of clear-and-distinct perception is *contentless* with respect to *what* is known and *how* beings are encountered — it prescribes a formal mark (clarity, distinctness) indifferent to the *kind of being* of the object — so its right to legislate for *all* cognition cannot come from the matters; it must come from somewhere else, namely a prior *idea of science*.

The rule is a rule for cognition, and indeed for *scientific* cognition; so Heidegger takes as guiding thread the *idea of science* that Descartes posits, asking *whence it is drawn*. Does Descartes draw his determinate concept of science from determinate *experiences of the history of cognition*, such that he wins the idea of science from that experience? For a quite strict uncovering of this origin a complete interpretation of the *Regulae ad*

directionem ingenii would be needed; Heidegger gives only the most necessary. Descartes determines science as a determinately characterized cognition: *Omnis scientia est cognitio certa et evidens* — all science is *certain and evident* cognition. *Certa et evidens* are the two moments that — the sentence breaks at the page boundary and the analysis continues into the next stretch of text. What is decisive is already in view: the rule of clear-and-distinct perception derives its universal authority not from the beings it judges but from a *prior idea of science* defined by *certainty and evidence* (*certitudo* and *evidentia*) — the idea whose mathematical provenance §15 named — so that the conversion of *verum* into *certum* is prepared at the level of the very concept of science. The criterion legislates for all cognition because it is cut to the measure of a *science of certainty*, not to the measure of the beings to be known.

Heidegger develops the origin of the criterion fully. *Certa et evidens* are the two moments that make cognition *scientific*, and from here springs the specific concept of *science* (the French *science*, used above all in the sense of mathematics and mathematical natural science), with the demand to *reject all merely probable cognitions* (*omnes probabiles cognitiones rejicere*) as un-scientific. In view of this idea of science we set ourselves the *rule* by whose help we come to the proper height of scientific and human existence; and the first thing, in prescribing rules for research, is the principle: *circa illa tantum obiecta oportet versari, ad quorum certam et indubitatam cognitionem nostra ingenia videntur sufficere* — one should occupy oneself only with those objects to whose certain and indubitable cognition our minds seem to suffice. The characteristic thing, Heidegger stresses, is that *out of the sense of the idea of science a quite determinate domain of objects is prefigured*, objects which alone have the kind to come into consideration as possible objects of scientific research at all — determinate object-fields are prescribed, others excluded *in advance*; so that, though the rule contains nothing about content-laden objects, it *passes a judgment over the whole realm of possible experience* by prefiguring objects answering to its sense. This is the full unfolding of the §3 inversion. The idea of science does not *find* its objects; it *legislates* in advance which beings may count as objects (only those of certain, indubitable cognition) and *excludes* the rest — so the choice of the field is dictated by the idea of science, not by the matters, exactly the predominance of the care for known knowledge diagnosed throughout Part One.

Descartes determines this idea of science (*cognitio certa et evidens*) more closely in its *structure*: its constitutive moments are the *intuitus* and the *deductio* (for *intuitus* also *experientia*: *nos duplici via ad cognitionem rerum devenire, per experientiam vel deductionem*). Heidegger fixes a crucial philological point: the concept of *experientia* here is the Aristotelian *ἐπαγωγή*, the *leading-to the matter itself*, not *ἐμπειρία*, "experience" in the sense of "empiricism." These two moments constitute the structure of the *intelligere* insofar as it is scientific knowing. The *intuitus* is the side of full-taken

knowing that has the basic function of *pre-giving the object* at all, so that all the various functions of knowing are, as to their proper enactment, *to be taken as judicia* — every *intuitus*, seen as knowing-being, is a *judicare*. The fundamental significance Descartes ascribes to the *intuitus* shows in the thesis that every *deception that can befall humans never comes about from a bad inference (mala illatio) but only from this, that certain insufficiently-understood experimenta are supposed*: the objective correlate of the *intuitus* is the *experimenta*, the simply-grasped as such, and the ground of deception lies in having, in the *judicium*, *insufficiently-understood experimenta as fundamenta*, or in judgments made rashly and without foundation. Through the genuinely-enacted *intuitus*, the *experimenta* are to be pre-given as the *fundamentum* for every *judicare*. And the *intuitus* is not a special faculty but *nascitur a sola rationis luce*, springs and has its being in the *lumen naturale*, in human reason — *voũç*. The weight thus moves first onto the *intuitus* as the *pre-giving of the fundamentum*. Two things matter for Heidegger. The reduction of *all* knowing to *judging* (every *intuitus* is a *judicare*) is reaffirmed; and the *intuitus* is identified with the Greek *voũç*, the *lumen naturale* — so the criterion of certainty is, at root, a transformation of the Greek doctrine of the immediate grasping of the simple, now made the foundation-laying of judgment.

From this idea of science the question arises: is there cognition that pre-gives its objects so as to satisfy the demanded enactment of the *intuitus*? Descartes' answer: *Arithmetic and Geometry are far more certain than the other disciplines, because these alone occupy themselves with an object so pure and simple (purum et simplex) that they suppose nothing at all that experience has rendered uncertain*; their objects can never return anything uncertain to a grasping directed at them, and so they have *the object such as we require*. Hence *only Arithmetic and Geometry remain, of the sciences already discovered, to which the observance of this rule leads us back* — yet not such that one should *limit* oneself to them, but such that *anyone seeking the right way to truth must occupy himself with no object that does not have a certitudo equal to arithmetical and geometrical demonstrations*. Heidegger draws the decisive conclusion: *the idea of scientificity and at once the idea of the constitution of the possible objects of a science are prefigured from the constitution of the objects of geometry and arithmetic*. This is the source of the mathematical norm of rigor whose uncritical absolutizing §15 condemned. The objects of all science are cut to the measure of the *purum et simplex* of mathematics; everything that cannot be given with mathematical certitude is excluded from science in advance — so the being of the objects is decided by the demand for certainty, not encountered.

Heidegger asks how Descartes drew this idea from mathematics, and *what the properly mathematical in arithmetic and geometry is*. Descartes posed this in an original way, by a *reflection on the history of the sciences*, from which springs the idea of the *mathesis universalis*: a sharper reflection on the course of the history of science and on the

structures of the disciplines counting as science lets an *underlying Urmathematik* be taken off, a primal mathematics with a quite determinate object-field, which is really *whence Descartes has his idea of science*. Here, Heidegger notes, shows itself a *peculiar entanglement of ontological and mathematical consideration — an entanglement still alive today, in a quite fundamental way, in Husserl's logic, which is to be a mathesis universalis*. This is a pointed historical thesis binding Descartes to Husserl. The Cartesian *mathesis universalis* (a universal science of order and measure underlying both arithmetic and geometry) fuses *ontology* and *mathematics*, and this same fusion governs Husserl's project of logic as a *mathesis universalis* — so Husserl's foundational ambition is, in its deepest form, *Cartesian*, and the regress to Descartes reaches Husserl's own ground. Descartes recounts his own history with mathematics: the ancients made discoveries but could not *rightly ground* them, and *no writer satisfied him* such that the disciplines answered to an idea of strict science; orienting at the *lumen naturale*, he shows how in it the *principles of all human knowing* are laid. *Though I shall say much here of figures and numbers — because from these fields the most evident and certain examples can be drawn — whoever attends to my sense will easily perceive that I think here of nothing less than common Mathematics (mathesis vulgaris), but expound a certain other discipline, of which these are rather the integument (integumentum) than the parts; the mathesis universalis is the fons, the source, of all the others*. The point for the lecture is that the rule of clear-and-distinct perception is the *projection of this mathesis universalis* — the universal method abstracted from the simplest objects — onto *all* cognition.

Heidegger gathers the result toward the lecture's question: he wanted to fix the *origin* of the two characters (clarity, distinctness) that regulate the encounter-mode of the *verum* as the *fundamentum* of affirmation. Descartes' determination of science as *certa et evidens cognitio* speaks *not of the object* of science but is *oriented at the idea of certainty and insightfulness*; the rule, in its rule-function, is related to cognition so grasped, and the whole consideration is led in advance such that *no orientation in a determinate being-domain is at work, but a consideration of wholly formal kind*. To the basic function of a *scientia* belongs the *experientia* (the providing of the ground) and the *deductio* (the progress); and we must ask whether *all* beings can come into question as a possible *fundamentum* of scientific grasping. The objects must be such that, when grasped, they can *return nothing of uncertainty* — must by their being-content be a *purum et simplex*; so the tendency is prefigured, for every science that claims a *certa et evidens cognitio*, toward the grasping of objects *simplicissima* (the simpler the object, the less the danger that something dark remains in its grasping). From the idea of science the *basic constitution of its possible objects* is prefigured, and the disciplines that yield such objects are arithmetic and geometry. The decisive thing, Heidegger underlines, is that Descartes oriented his idea of science *not* at a *given* form of

mathematics but at a *conception he himself developed* — at the idea of science as *clara et distincta perceptio*; and the tendency to go back, behind the given mathematical disciplines, to the *mathesis universalis* has for him the sense of exhibiting *how the idea of a scientific method in general can form itself in this science*, so that not only the idea of the possible objects but, *in a determinate radicalization, the idea of method and of method-formation* is won from mathematics. The criterion is thus doubly mathematical: mathematics furnishes both the *objects* (the simple) and the *method* (the universal *mathesis*) — and this is a *self-made* projection, not a finding.

The reflection on method-formation stands, Heidegger continues, in a general reflection on the *possibility of science*, in which Descartes must take a stance toward the *learned tradition* and the occupation with traditional opinions — he has *scholasticism* in view, with its working by citing and discussing *authorities*. Against this, *Regula III: concerning the proposed objects, one must seek not what others have thought or what we ourselves conjecture, but what we can clearly and evidently intuit or certainly deduce; for science is acquired in no other way*. From this, Heidegger says, it is evident how Descartes, *not directly but indirectly, already prepares the impossibility of understanding at all what historical science, as we know it today, is* — a *positive turning-away* from the possibility of coming to a science in this field. And it is *no accident*, he adds pointedly, *that in today's phenomenology the same impossibility is given, precisely in this fundamental incapacity to understand humanistic-historical cognition at all*; so it seems somewhat *grotesque* that today, within the *Geisteswissenschaften*, one is busy helping oneself with phenomenology — *the ground for this specific tendency of history-hostility lies here with Descartes*, though with Descartes it is motivated in wholly other horizons than today. This is a sharp polemical alignment. Husserl's phenomenology shares with Descartes a *constitutional inability to understand history* (the very inability §§13–14 exposed in the critique of historicism), so that the contemporary attempt to ground the *human sciences* on phenomenology is self-defeating — and the root is the Cartesian idea of science as certainty, for which the historical (the changeable, the once-only) cannot be an object.

Descartes holds that the *study of the ancients* has only the sense of letting us establish *what is already found* and see *what remains to be thought out* (*quaenam supersint excogitanda*) — a search history can perform; and the scholastic discussion of authorities is failed because *what is tenable in any science is found not by the many but by the few* (*magis credibile est eius veritatem a paucis inveniri potuisse quam a multis*) — and even if I appropriated *all* the proofs found, I would not thereby be able to conduct a mathematical inquiry. The sharp *opposition between science and history* is explicit: *if we read all the arguments of Plato and Aristotle but cannot pass a stable judgment* (*stabile iudicium*) *about the proposed matters*, nothing is gained. Heidegger turns this around for his own situation: from the *scientific* situation Descartes' stance to history (as

mere *erudition* of secondary purpose) is understandable; *but today's situation is reversed*, and for one who surveys it, *only by way of a radical historical critique can one come at all to the ground for a possible philosophical research — whether that is "philosophy" is then an irrelevant question*. This is the methodological self-affirmation of the whole lecture against Descartes. Where Descartes opposes *science* to *history* and demotes the latter to *erudition*, Heidegger holds that *radical historical critique* (the *Destraktion*) is now the *only* road to the matters — so the *Destraktion* of Descartes is itself the enactment of the historical philosophizing that Descartes made impossible, and the "end of philosophy" of the *Vorbemerkung* is here restated: it does not matter whether this still counts as "philosophy."

Finally Heidegger fixes the two *demands on method* that Descartes distinguishes after rejecting the importance of historical cognition: the method must be such that it puts me in a position *never to take a falsum pro vero*, and such that it puts me in the possibility of *coming to the cognition of all the objects in question*. These map onto the two basic components of scientific cognition: the *intuitus* (which must be *right* so that it offers the *deductio* no false *fundamentum*) and the *deductio* (which must proceed *stepwise* from the *fundamentum*); there is no science unless both are carried out so as to answer to the sense of science. Guided by this idea of method, Descartes considers the *history of mathematics* and finds that it increasingly took its object-domains in an ever stricter sense — *there now flourishes a kind of Arithmetic called Algebra, to do for numbers what the ancients did for figures* — so that the *fruits* fall out of the *methodical principles laid in us* (*fruges ex ingenitis huius methodi principiis natae*), the development of these principles being a *spontaneous ripening of the basic possibilities of knowing that lie in us*, a *nescio quid divini*, an I-know-not-what of the divine. Though the mathematical disciplines now bear this fruit, they have not reached *perfect ripeness* (*perfecta maturitas*); Descartes wants to *radicalize* what mathematical cognition strives for — not to hold to determinate object-domains of mathematics but to go *beyond the content-determination of mathematics to method as such*, to the first components around which all mathematical cognition moves: the idea he calls the *mathesis universalis*. He confirms it historically: suspecting why the first founders of philosophy would admit no one ignorant of *Mathesis* to the study of wisdom (*μηδεις ἀγεωμέτρητος εἰσίτω*, let no one ungeometried enter), he supposed they recognized a *Mathesis* very *different from the common one of our age*. This idea is to be taken up and developed, going behind these connections to ask *what is common* to all these disciplines. Orienting first at the name, *mathesis* formally means *disciplina* — teaching, learning, learnability, intersubjective communicability, the *taking-in-experience in a determinate way* — and is distinguished in that the mathematical method proceeds such that one does *not* expressly *make present* what is to be experienced each time, but on the ground of the *conclusiveness of an inference* comes to its result — the sentence

running on into §37. Heidegger has thereby exhibited the full pedigree of Descartes' criterion: it is the *mathesis universalis*, the universal method of the *learnable* (*disciplina*, the *μάθημα* of §3) abstracted from the simplest objects and projected onto all cognition — and the closing remark, that mathematical method *does not make the matter present each time* but proceeds by the *conclusiveness of inference*, already names the move that converts *truth* (the self-showing of the matter, ἀληθές) into *certainty* (the secured conclusiveness of the chain), the conversion §38 will state outright.

Heidegger completes the analysis of the *mathesis universalis*. The mathematical method proceeds such that one does not expressly make present what is to be experienced each time but comes, on the ground of the *conclusiveness of an inference*, to determinate results that thereby prove valid; and the *common* element extends to *ordo vel mensura*, order and measure. It does not matter whether in a determinate domain — numbers, sounds, spatial figures — the measure is sought; there must be a *certain general science that explicates all that* can be explicated about order and measure as such, without any determinate content being added. So the *mathesis universalis* is *the formal science of pure order- and measure-connections as such*. The possibility of the *mathesis* shows that the mathematical disciplines, though they themselves already pre-give clarity and simplicity of objects, can go back to *the simplest objects*; a science must be brought back to its *simplest moments — always beginning from the simplest and easiest, never proceeding to others until nothing further is to be wished in these*. Vulgar mathematics gives Descartes a certain *order*, which he now grasps *absolutely*, for every science as such; the essential is that such orders are *uncovered and held through* in the enactment of research, for only then is it possible to *conclude from really secured fundamenta*, the *deductio* being the way the totality of the objects of a scientific field is grasped. The idea of method thus includes the idea of *series*: the series is the guiding thread of method-formation, since one proceeds *from the simplest objects to the composite*.

In *Regula VI* the question is treated: what must a series contain in order to take the lead of all scientific cognition? *All things can be ordered in certain series — not* insofar as they are referred to some *genus of being* (as the philosophers divided them into their categories), *but insofar as ones can be known from others*. Heidegger fixes the decisive point: the *series*, as the guiding thread of all methodical research, is *not drawn from the matters*, from a generic being-determinateness, but the marking-off of the possible series in an object-field must be oriented by the series' *prefiguring the path of the knowability of one from another* — so the series is won not with regard to the content-objects but, *insofar as they are considered among themselves, with regard to their possible knowability in the sense of the deductio*. This is the deepest stratum of the inversion. The order in which science proceeds is fixed not by the *being* of the matters (their generic articulation, the Aristotelian categories) but solely by their

knowability-from-one-another — by the requirements of *deduction* — so that the structure of the field is dictated by the method of certain cognition, not read off the things.

From this tendency arise two determinations: things are *res absolutae* and *res respectivae* — the *reflection of the intuitus and the deductio*. The *intuitus* always has an *absolutum*, the *deductio* a *respectivum*; the *respectivum* has in itself an *involutum*, that to which it is back-related, very often an *obscurum* that must be *unwound*. The most diverse things, in their being-content, are grasped under these *formal* categories; the whole tendency of method-formation is *nothing other than a consistently carried-through mathematization*, in which no value is placed on whether determinate categories themselves show content. Under the *absolutum* fall *independens, causa, simplex, universale, unum, aequale, simile, rectum*; under the *respectivum*, *dependens, effectus, compositum, particulare, multa, inaequale, dissimile, obliquum*. Heidegger draws out the telling case of *causa*: Descartes expressly takes *causa* into the *res absolutae*, although *causa* is properly a *correlate-concept*, related to *effectus*; but with regard to the *order of knowing* — what is to be settled first — the *causa* is an *absolutum*, because only when it is itself clarified is it possible to go further in the *deductio*. *The secret of the whole method is to win, in the various cognition-series, the absolutum* — not the *content-absolute* but the *methodically absolute*; and something can be absolute in one respect and respective in another (the *universale* is an *absolutum quia naturam habet magis simplicem*, but with regard to its origin from the *individuum* it is a *respectivum*). So the weight of this whole forming lies in the *grasping of the objective in the rule*, not in the matters.

Finally Descartes seeks an *order of objects* answering in themselves to the character of *simplicitas*, and sets, *for various being-domains, a unitary dimension of uniform simplicity* of the objective — the *simple natures*: *res pure intellectuales* (known by an innate light, without the aid of any corporeal image — *what cognition is, what doubt, what ignorance, what the action of the will*), *res pure materiales* (*figura, extensio, motus*), and *res communes* (*existentia, unitas, duratio*, ascribed indifferently to bodies and spirits). Their *content-difference does not interest him at all*. Heidegger remarks that, modern-spoken, the *res intellectuales* are here an *essence-grasping of certain consciousness-acts*, set by Descartes as graspable through the *lumen ingenitum* without further ado — and he adds the pointed aside that *Scheler merely took over this position*, extending the essence-grasping from consciousness to the universal being-connection, the ground for which lies in the *old ontology* that has pressed into the present through various channels. Among the simple natures Descartes even counts *their privations and negations* (*what nothing is, what an instant, what rest*), since the cognition of these is no less true. And Heidegger draws the conclusion that governs the whole section: *this outline of the simplest things, which on the idea of the scientia is to*

give the possible fundamentum for the corresponding science, shows that it is not won at the interrogation of the various being-domains. The "simple natures," the supposed bedrock of all knowledge, are *not* read off the beings but *projected* from the requirements of the *mathesis universalis* — so the whole Cartesian table of the knowable is a methodical construction, indifferent to the *being* of what it orders, and Scheler's material value-ethics, by extending this essence-grasping to all being, inherits the same un-interrogated ontology.

§ 37. The care of cognition as care of certainty, as self-overreaching

Summarizing, Heidegger says the origin of the content of the *regula* shows itself in a twofold respect: with regard to *what* the rule regulates, and to *how* it regulates. What it regulates is the *scientia*, read off from the pre-given mathematical disciplines; *how* it regulates is carried out on the way of the *method* read off from mathematics. And the *experience* of these determinately pre-given sciences is such that science is seen *in advance* not with regard to the *content of the objects as such* but with regard to the *encounter-mode of the objects for assenting knowing*. So the care that gives itself a self-interpretation in the content of this rule, and places itself under the rule so grasped, *reveals itself thereby as the specific care of certainty*. It shows that the care of cognition *does not dwell at a being qua being*, does not go to objects with regard to their *content*, but goes to them in the *how of their graspability*, this graspability seen on *assent*. The *dwelling* (*Aufenthalt*) of the care of cognition, as care of certainty, is thus a quite peculiar one — and one must make this science-experience clearly accessible in its peculiarity to understand the treatment of content-objects it leads. And the decisive formula: the dwelling of the care at determinate sciences in this quite determinate respect shows that *the esse as verum, and the verum as certum, is primarily placed in the care, so that the ens reaches its task only on the detour over the certum*. This is the central thesis of the chapter, stated for the first time outright. The care of certainty does not attend to *beings in their being* but to the *certainty of their graspability*; *truth* (*verum*) is grasped only as *certainty* (*certum*); and *being itself* (*ens*) comes into view only *through* the detour over the certain — so the question of *being* is displaced in advance by the question of *certainty*. The conversion of *verum* into *certum* is at once the subordination of the question of being to the question of method.

This care of certainty places the rule it forms in a determinate *claim*: it does *not* limit the rule to its specific origin-domain (mathematics) but gives it as a *regula generalis*; the care forms with the rule a *fundamental claim*, such that the norming rule at once says: *only that cognition is science at all which satisfies the rule*. The original ground is *given up in the formation itself*. This claim leads Descartes to *exclude* certain cognition-possibilities from the domain of science, or to *reform* pre-given disciplines in the sense of the rule — shown above all in his demonstration that *historical cognition*

does not come into question as an independent matter-knowledge but can have only *propaedeutic* value. Descartes reforms *all* the fundamental sciences — theology, metaphysics, mathematics — in the sense of the *regula generalis*; with respect to *physics*, against the old physics that aimed primarily at the *qualitates substantiales*, he insists on taking the objects of physics only so far as they satisfy the rule — *I may take up only the extensio*. (Heidegger notes that the *regula generalis* was in fact there for Descartes very early; it was only a matter of grasping it explicitly and characterizing the mathematical disciplines in its sense.)

How Descartes *reformed and took up* specifically theological and philosophical doctrines under the guidance of the rule shows in the *fate of the doctrine of innate ideas*, which he had taken from the contemporary movement of the *Oratory*: that to the being of the human belongs an *idea of the being of God* — a doctrine given that stress *apologetically*, to win a foundation against atheism. Descartes seized it and built it into his doctrine of the *clara et distincta perceptio*; and he *had* to, in order to come clear about cognition at all. For there was a *scholastic doctrine* that intellect-cognition is possible only if a *fundamentum* is in some way pre-given to the *intellectus* — the Aristotelian thesis οὐδέποτε νοεῖ ἄνευ φαντάσματος ἡ ψυχὴ (the soul never thinks without a phantasm), the *phantasmata* being the phenomena that for scholasticism make up the *transition* between the specifically sensible and the intellectual cognition (a difficult problem, since it concerns how a sensible being passes over into a spiritual one): sensible cognition pre-gives the intellect the *species intentionales*, on which the *intellectus* tends as a *fundamentum* — and *these species intentionales are the ground for the explication of the concept of the intentional*. This whole Thomistic conception of cognition Descartes *could not accept in advance*; for him it stood fixed that, in the sense of the *clara et distincta perceptio*, the *corporeal* is graspable *only as extensio*, and all the other determinations of corporeal being (the physiological intermediate field) do *not* come into consideration. So in taking up the fundamental task of clarifying cognition he *cannot* engage this intermediate field; the moment he does, he grasps only an *obscurum*. He therefore built the doctrine of innate ideas into his own, and, *led by the rule, must relocate the interpretation of cognition into the field that becomes accessible in the sense of the rule itself* — one of the clearest examples of how the reformation of theological and philosophical problems is carried out with the astonishingly consistent application of the *regula generalis*. Two points matter for Heidegger here. The lineage of the very concept of *intentionality* (the *species intentionales* of scholasticism) is exposed — so Husserl's intentionality, like the *cogito*, has a medieval pedigree. And Descartes' restriction of the corporeal to *extensio*, and his banishment of the "physiological intermediate field" as *obscurum*, is the rule's doing: the criterion of clarity *decides in advance* what may belong to the body (only the mathematically graspable, extension),

excluding the lived, sensible, transitional phenomena — the same covering of the *φαινόμενον* seen in the pain-example.

The care thereby reveals itself, in this its claim, by *overstepping its origin-domain*, as a *Vergreifen* — an overreaching, a grasping-amiss — *with regard to its ownmost possibilities*. It overreaches: it does *not* hold to what it is, in the sense of the rule, *adequate* to, cut to; in this self-interpretation the care *no longer sees its ownmost possibilities* but *overreaches itself*, insofar as it interprets the rule as a *generalis*. And this overreaching is carried out such that it becomes a *self-heightening overreaching* (*sichaufsteigerndes Vergreifen*), *covered* by the fundamental significance it ascribes to itself: since the *regula* is precisely a *regula generalis* and gives itself as *the only possible way of strict cognition*, its overreaching is *held in the background*. The consideration of the claim-character that the rule sets in its content thus reveals the care of cognition as the *care of certainty in the sense of the heightening self-overreaching*; and in this being of knowing a quite determinate *movedness of Dasein* shows itself, which leads the formation of scientific ideas and the whole *Dasein*-interpretation. This binds the *Sorge*-structures of §12 (*Verfängnis*, the self-entanglement) to Descartes: the care of certainty *overreaches* itself by universalizing a rule cut to mathematics, and *covers* this overreaching precisely by claiming to be the sole road to strict science — the self-heightening, self-concealing movedness of *Dasein* that drives the whole modern interpretation of being.

§ 38. The care of tranquilizing. Descartes' interpretation of *verum* as *certum* under retention of scholastic ontology

As *what* does the being of knowing show itself, Heidegger asks, with regard to the way the rule is taken as a *whole* — seen on the phenomenon that this rule is won as a rule at all? What does the *rule-taking itself* reveal for the being of knowing as a determinate care? We know that the being of knowing is characterized as *judicium*, as *modus volendi*, as *propensio in bonum*, and that the *bonum* for the *propensio* of the *judicium* is the *verum*. The rule-taking shows that the care of cognition grasps the *verum in advance in the sense of the certum*: truth is primarily grasped as *certainty*, and the *propensio* of the *voluntas* is oriented at being-set toward *this* bonum — so the *bonum* becomes *not* the *verum* but the *verum qua certum*, and the care, from itself, interprets the specific *perfectio* of the human such that the *voluntas qua judicium* is laid out as *propensio in certum*. The human's highest possibility (the will's assent) is thereby re-aimed: from the true to the *certain*.

This so-interpreted *certum*, as the *bonum* of the judgment's *propensio*, is at the same time *relocated into the being-connection that exists in advance*: the cognition-possibility so grasped is seen from the basic determination of the human as an *ens medium*. And

here, Heidegger says, we see more clearly that *the ens medium is no ens medium*: the weight of this being, grasped as *perfectum*, *shifts in the direction of God*. Insofar as this *ens medium* is an *ens creatum*, it is *determined* in its possibilities as created, and with respect to these possibilities also *secured*; a *propensio in bonum* is thereby *secured in its possibility*. Into this connection of the *secured ens* the new interpretation of knowing as *propensio* is relocated — that is, *the care of certainty secures itself in advance the ground on which it determines its own being*. The care of certainty, which by its primary aspect looks like a *radical reflection on the fundamentum of cognition*, is a *tranquilizing (Beruhigung) of knowing as a being-possibility of the human*: the care of certainty as heightening self-overreaching is, in one with this, the *care of tranquilizing*. This is the conceptual destination of the whole Descartes-interpretation and the bridge to Part Three. Descartes' doubt and his search for a *fundamentum* are not a genuine radical questioning but a *self-tranquilizing*: the care *secures itself in advance* — through the creation-ontology (the human as created, hence secured in his possibilities) — the very ground it pretends to win by doubt, so that the whole movement is a *coming-to-rest*, a *Beruhigung*, that forecloses any fundamental *being-insecurity*. The existential *Beruhigung* of *Sein und Zeit* (the tranquillized self-certainty of everydayness, the flight from anxiety) is here read out of the founding text of modern philosophy.

This peculiar phenomenon in the cognition-movedness, decisive in Descartes, will show itself still more peculiarly in the *doubt-consideration*: *the way of the doubt-consideration is a mere semblance*, and *the radical reflection is only semblance, merely a becoming-explicit of quite determinate pre-grasped foundations and possibilities*. Accordingly, Heidegger says, *every attempt to come to a ground on the guiding thread of the cogito is to be avoided*; for at closer view there shows itself a *peculiar relocation of the sense of the verum*, with which a *quite unobtrusive but fundamental rearrangement of the basic determination of the being of the human* is given. As the care interprets itself by giving itself the rule, it determines the *verum as certum*; but this so-determined *verum* is *relocated into the old ontology as the self-evident foundation* of the whole explication, and *the verum reformed into certum is at once retained as bonum* — the *bonum* answering to the *natura hominis*. Through this relocation an interpretation of the being of the human is carried out such that his *perfectio is heightened* — heightened so that this heightening is in advance held under the *guarantee*: being-created by God and being-determined to reach the *bonum qua verum*. This relocation characterizes the care of cognition that performs it as the *care of tranquilizing*, and finally as the *care of certainty that in advance blocks off every possibility of a fundamental being-insecurity*: the being of knowing has *tranquilized itself in advance* by taking up the interpretedness of the being of the human as *creatum*. This is the precise mechanism of the self-tranquilizing. Doubt only *looks radical*; in truth the *verum* is silently converted into *certum* and lodged in the *unchanged* scholastic

creation-ontology, which *guarantees* in advance that the human (created, ordered to the good-as-true) *will* reach certainty — so the whole apparatus is insured against any genuine *insecurity of being*, and the "discovery" of the *cogito* is the explicit appearance of a foundation secured beforehand. This is why Heidegger warns against *any* attempt to win a ground by the *cogito*: it is the model of self-tranquilizing, not of radical questioning.

Heidegger insists on the right reading of this. One must make the connection fully present to see how, *through Descartes, the old stock of scholastic ontology is unawares reformed — but not in such a way as if it had mattered to him to ground an epistemology. Epistemology does not matter to him at all*; these are *purely ontological considerations*, in which the phenomenon of cognition plays only a *secondary* role. The peculiar reformation lies in this, that *he interpreted the verum as certum while leaving the whole ontological grounding in place*, so that this *leaving-in-place brought with it a reinterpretation of the being of the human*. This is the corrective to the standard picture of Descartes as the founder of modern epistemology. Descartes is doing *ontology*, not theory of knowledge; the *cogito* is an ontological, not an epistemological, move; and the whole modern "problem of knowledge" is a by-product of an ontological reformation (*verum* into *certum*) that left the inherited being-doctrine untouched and thereby silently redetermined the being of the human.

He documents the inheritance with Thomas. *The intellect cannot not assent to principles naturally known, and likewise the will cannot not adhere to the good (intellectus non potest non assentire principiis naturaliter notis; et similiter voluntas non potest non adhaerere bono)*; the *determinatum esse in bonum* is given for the *natura hominis* just as the *determinatum esse in verum* for the intellect, which is ordered to the *bonum* by nature; the *determinatio in bonum* is the closer determination of the being of the human as *creatum*; and *the apprehension of the true is not in our power (apprehensio veri non est in potestate nostra)* but happens by the power of a *light*, natural or supernatural, so that the *actus rationis* is *subject to the natural being-determined of the human*. From such passages, Heidegger shows, *Descartes takes up this ground but reinterprets the natural ordination to the verum so that he posits the verum as certum*; and the *certum* includes a *quite specific truth-concept, originally cut only to mathematics, which has jumped over its origin-domain and expanded to an absolute dominance. Every clear and distinct perception is without doubt something (aliquid) — and as something, not nothing, it necessarily has God as its author*. the truth of the *regula generalis* is exhibited by its being a *findable res*, and every *res* is as *ens verum*, so the *perceptio*, as *created*, is a *verum*, and hence *universally binding* — just as the mathematical principles and the basic rules of mathematical method are nothing but the *spontaneous fruits (fruges spontaneae) of the semina*, the seeds gathered in the *clara et distincta perceptio*, and these *semina* are *aliquid divini*, something divine, having their being as

derived through their being-created by God. The basic rule is relocated into the being of the human, determined as *medium ens* — but this *medium ens* has its peculiar weight *in the bonum toward the ens perfectissimum*, and is in fact no proper *medium* but *lies near God*. And Heidegger names the upshot: *here shows itself an extreme Pelagianism of theoretical cognition*. This is the final, devastating verdict of Part Two. By converting *verum* into *certum* and lodging it in the creation-ontology, Descartes makes the human's clear-and-distinct cognition a *divine seed* (*semina, aliquid divini*) by which the human, "lying near God," reaches his perfection through his *own* knowing — a *Pelagianism* (salvation by one's own power, without grace) transposed into the theoretical: *the human saves himself by certainty*. The will's assent to the clearly-and-distinctly perceived, modeled in §27 on the grace-determined turning to the good, has become its own grace; and the care for known knowledge stands revealed as the self-redemption of the *ens medium* through certainty — the deepest form of the flight from the insecure, finite *Dasein* that Part Three must finally bring into view.

Chapter Six: The being-character of the *res cogitans*, of consciousness

Now, Heidegger says, we are prepared to answer *radically* the decisive question — the question of the *being-character of consciousness* as the thematic field of phenomenology — and we will decide it through the determination of the *being-character of the res cogitans*. We will see *how, through the characteristic care of cognition, the cogito is found*, and which being-character the *cogitare* must have. The consideration of the way on which knowing arrives at the *cogito* is divided into three respects: what the care of cognition is *out for* in the effort around what springs out as *cogitatio* (the *sought*); the *enactment-mode* of the seeking; and the *concrete way* this seeking takes.

§ 39. The *certum aliquid* as the sought of the care of cognition

The *cogito sum* springs out, in Descartes, in a fundamental task before which he places cognition: first of all to *found a fundamental science*, to provide a *fundamentum* for cognition that is a *fundamentum indubitabile*, fully satisfying what the *regula generalis* demands. The so-directed seeking must enact itself from the *situation* in which the effort for such a *fundamentum* arises, by *running through the possibilities of cognition* given by Descartes' concrete scientific situation — a searching running-through that enacts itself in the sense of the *care of cognition*. The *sought*, Heidegger says, is easily determined: it is the *certum*, such that Descartes cares only to find a *certum aliquid*, a certain *something*; *what* it is, is secondary — if it only satisfies the rule, its *What* is ultimately *indifferent*. He cites the sharp stress: *I shall proceed until I know something certain, or, if nothing else, at least this very thing for certain, that there is nothing certain — what I may find that is certain and unshaken (inconcussum)*. The specific

being-character of the sought does *not* primarily come into consideration; only that the to-be-found is interrogated as to *whether it satisfies the rule* — *what* it is, which being it has *from itself*, does not come into question at all. This is the first and most consequential observation of the chapter. The *cogito* is sought purely as *a certain something*, an *inconcussum*, with complete *indifference to its kind of being* — so the famous foundation of modern philosophy is determined *only* by the formal demand for certainty, never by the question of *what* and *how* the *res cogitans* is. The omission of the being-question is built into the very search. Heidegger adds that the third respect will sharpen the sought: since the rule must satisfy the *series-principle*, the sought must be not merely a *certum* but a *certum qua absolutum et simplex* — a demand prefigured by the *regula generalis* itself.

§ 40. The caring seeking as *dubitare*, *remotio*, and *suppositio falsi*

The second moment is the *seeking itself*. The seeking is a seeking of *cognition*, such that knowing *holds look-out*, the seeing of the care being out to get into view something that satisfies the *certum*; and all that, in the concrete situation, is present as *obscurum* or *incertum* is *set back*. This is enacted by knowing, as *judicare*, in the manner of *dubitatio*: the *judicare* refuses its *assensus* to what is pre-given as *obscurum*, and so the *judicare* becomes an *abstinere*, which in the extension of its enactment becomes a *continere*. This enactment-mode is more precisely determined in that what does not satisfy the *dubitare* does not come into question as a possible *fundamentum* — the *dubitatio* enacts itself as *remotio*, a removal. And this *remotio*, as a not-letting-come-into-question, ends in Descartes in a peculiar *suppositio*: *the dubitatio incerti becomes a suppositio falsi*. The doubting of the uncertain reforms itself into the *assuming of this uncertain as false*; and this transition has, for Descartes, nothing impossible. Precisely in this radicalization, Heidegger stresses, the basic property of knowing as *judicare* reveals itself — its *libertas*: such that *the more the seeking knowing holds to its own determinatio in bonum qua certum, the more free this dubitare is*. For we have heard that *being-free consists in making earnest with the suppositio falsi*. This binds the doubt to the voluntarist theory of judgment (§§27–28, §34). The methodical move from *doubting* the uncertain to *supposing it false* is an exercise of the *will's freedom* (the *determinatio in bonum qua certum*): the more rigorously the will withholds assent and supposes the doubtful false, the freer it is — so Cartesian doubt is the will's self-determination toward certainty, not a neutral logical operation.

Heidegger shows the move schematically. The *incertum*, which for Descartes is the object of the *dubitatio*, is nothing other than the *non verum*, since the *certum* is the *verum*; as *non verum* the *incertum* is in itself already *falsum*; and as *falsum* it is *non ens*. *Therefore Descartes comes to say: the pre-given does not exist*. This possibility grounds in the connection explicated above (the chain *certum* = *verum*, *falsum* = *non*

ens of §§28–38). In the holding of this *suppositio* — which is at the same time the holding of the *seeking of the certum* — the consideration proceeds, and in the attempt to proceed the seeking *strikes upon something* that it must now address as *properly found*, as the found that answers to the seeking. The whole logic of methodical doubt is thereby exhibited as a consequence of the conversion of *verum* into *certum*: because the uncertain is the non-true, hence the false, hence the non-existent, the doubt can *posit the doubtful as non-existent* — and this universal positing-as-non-existent (the *suppositio falsi*, the hyperbolic doubt) is the means by which the seeking is driven to its end and the *cogito* extracted.

§ 41. The way of the caring *dubitatio* in the First Meditation under the effectiveness of the *regula generalis*: the being of being-seeking (*ego sum*) as the first found

The way of this so-characterized *dubitatio*, in the concrete situation into which the inquiry is placed, runs through the *possibilities of grasping objects*, the possibilities of the *encountering of beings* as they are known to Descartes — the way Descartes runs through in the First Meditation. Two things are to be considered: *what* is run through, and *how*. Heidegger stresses that Descartes holds fast a determinate *ordo* and sets value on its being heeded, for it belongs to the sense of his method: *he could follow no other order than that usual among the geometers*. This *ordo* is fundamental and is none other than the geometrical one — the *going-back to a certum that is an absolutum and simplex*, sufficient to give the starting-point for every *deductio*. *What I seek cannot be an ens respectivum*; it must again be a *simplex*, not a *compositum*. This last point is of fundamental importance for understanding the procedure. Otherwise one could ask: why does Descartes not simply say, *I grasp the extensio of the stove, and this my grasping I cannot doubt* — why does the regress to the *cogitatio* not set in earlier? One understands this running-through only by keeping in view *what* Descartes seeks: *certum, absolutum, simplex*; the doubt cannot stop before such a *certum* is won. This dissolves the standard puzzle about the order of the Meditations. Descartes does not halt at the first indubitable perception (e.g. of extension) because he seeks not just *something* certain but the *absolutely simple* foundation for a *deductio* — the geometrical *ordo* — so the doubt must press on, removing everything composite, until it reaches the one *simplex* that can found everything.

Descartes grasps the possibilities of pre-given seeming-truths as a *sensibus* or *per sensus*: what he had taken as true is given either *through* sense-perception or *with the participation of* sense-perception (the latter holding for the mathematical and geometrical truths insofar as they are bound to *intuitions*). The care goes through both ways — not criticizing each individual act of experiencing, but holding to the *principles* of these accesses to beings. And he carries out the consideration of both ways such that he *increasingly switches off*, shaping the *remotio* ever more radically, so that finally

nothing can show itself that *legitimately* corresponds to the criterion. What falls to this *remotio*: all that is given through the senses; and at the same time basic determinations like *locus*, *tempus*, *duratio* — which Descartes *later* fixes as *not* perceived through the senses but through the *intellect* (on which he builds a strict physics that sees only the *corporeum qua extensum*), but which *here* must equally fall to the *remotio*. Descartes even switches off *arithmetic and geometry*: what they say is *simplex* and *maxime generale*, yet is *not* recognized as sufficient. The whole doubt-way, Heidegger says, *shows nothing other than the peculiar effectiveness of the regula generalis*; and here, on this ground, Descartes shows in fact an *admirable radicality of philosophizing* — but it must be *denied* that the *origin of the rule itself is philosophically radical*. This is the carefully calibrated verdict. The *execution* of the doubt is genuinely radical (nothing escapes the *remotio*, not even mathematics); but the *rule* that drives it — the idea of science as certainty, projected from the *mathesis universalis* (§36) — is *not* radically grounded but inherited and uninterrogated. So the doubt is the rigorous *application* of an un-rigorous presupposition; its radicality is real but derivative.

Heidegger then re-runs the way at the level of *access-modes*. Knowing as *judicare*, under the rule, is set the task of finding the *fundamentum* for all possible cognitions out of the *determinate situation* of cognition — the having-available of quite determinate opinions, a determinate orientation in cognition-opinions, the living in determinate *basic convictions about being itself*. The available is interrogated as to *how it presents itself*, how it satisfies what the rule demands; and what is found insufficient is *not* merely kept as uncertain — Descartes passes from the *dubitatio incerti* to the *suppositio falsi*. This transition is justified not only by the *dubitare* thereby reaching its freedom but has the *task* of bringing the seeking into a quite determinate *end-situation* out of which the sought is found; and for the philosophical understanding of Descartes it is *indispensable* to bring out this *underground connection* — the consideration must be understood in connection with the *idea of the sought*, the *sense of the rule*, and the *prefigured way of the series*, the method.

Descartes subjects the *opiniones* to an *eversio generalis*, a general overthrow — not critiquing each individual conviction, but, in the sense of what he seeks (a *fundamentum as principium*), confronting only the *principia* of these opinions with the rule. And the *principia* of opinions, Heidegger glosses, are nothing other than the *starting-points* whence he comes to what he opines — the *accesses* to it, the *dealings* with it, so that they are *orientingly grasping*; these various *access- and dealing-modes of the living* are the *principles*, not propositions. There are access-modes *a sensibus* and *per sensus* (with the participation of the senses, above all in the *imaginatio*) — a division fixed following the traditional partition of consciousness — and these access- and dealing-modes are critically interrogated. If, with respect to them or to what is grasped and given in them, an *incertum* shows itself, Descartes does not leave it so but lets it fall

to *remotio*, so that the given in it is *posited as not-being* and the access-mode no longer comes into question for the seeking. (Heidegger inserts the pointed parenthesis: *what Husserl means by the reduction is something totally different.*) These access-modes, falling to *remotio*, no longer come into question; the *end-situation* forms itself through the *remotio*, and the seeking is at the end of its way so placed that it is *placed before nothing and before the nothing of its own possibilities*. Two things matter here. The "principles" doubted are not propositions but the *access- and dealing-modes* of a living being — its ways of being-toward beings — so Descartes' doubt is, beneath its propositional surface, a removal of the *modes of being-in-the-world*; and Heidegger sharply distinguishes the Cartesian *remotio* (which *posits the doubtful as non-being*) from Husserl's *reduction* (which merely *brackets* the positing of being), guarding against assimilating the two.

Heidegger follows the text. Descartes begins at the access-mode of *sensible perceiving*: there are many things that *cannot plainly be doubted*, though drawn from the senses — *that I am here, sit by the fire, am clothed in a winter gown* — determinate givennesses co-given with the concrete environment. This is confronted with the rule: is a *fundamentum certum* thereby pre-given? The answer is negative; and Descartes says that what is so given is at first sight in no way to be doubted as uncertain — *by what reasoning could it be denied that these hands and this whole body are mine?* — unless I were to compare myself to the *insane*, whose brains are so disturbed that they constantly assert they are kings when they are paupers, or clothed in purple when naked, or have heads of clay, or are gourds, or made of glass; *but they are mad, and I would seem no less demented if I transferred their example to myself*. But then comes the *dream*: *as if I were not a man who is accustomed to sleep at night and to undergo in dreams all the same things* — how often the nightly rest persuades me of just these usual things, that I am here, gowned, sitting by the fire, when in fact I lie undressed in bed; and *attending to this more closely, I see plainly that waking can never be distinguished from sleep by certain marks*. This shows, Heidegger says, that what is so given is *not without further ado a certum but an obscurum*, since the determinate access-mode of having-my-environment is determined by *being-awake*; and since this being-awake cannot be distinguished from the other dealing-mode in *dreaming* by an absolutely clear criterion, these two access-modes cannot come into question as accesses to a possible *fundamentum* — they belong to a being-realm that for Descartes is *in advance an obscurum*, the *intermediate realm between the res extensae and the res cogitans*. The dream-argument is read not epistemologically but *ontologically*: it consigns the whole realm of embodied, environed, perceptual life (the "intermediate realm" between pure extension and pure thought — the lived body, the world of dealings) to the *obscurum*, excluded in advance by the rule. The φαινόμενα world of

being-in-the-world is removed *because* it cannot meet the criterion of certainty — the decisive covering.

The consideration presses on through the *generalialia* to the *universalialia*. Even if the particular stove does not exist, what of *the idea of something in general* — *at least these general things, eyes, head, hands, the whole body, exist as things not imaginary but true?* (Heidegger notes the whole discussion is carried out on the ground of the wholly *formal* concept *res*.) But perhaps even these *generalialia* are not something I can say *are*; perhaps they still contain something of specifically sensible characters — *they could be imaginary* — insofar as with the *general* stove the *idea of coloredness* is co-given; so, though more general, these *generalialia* are, with respect to this provenance, not to be addressed as *being*. And indeed I find at the stove the *extensio* (a *magis simplex et universale*), the *figura* of extended things, *quantitas, magnitudo, numerus, locus, tempus* — *universalialia* over against the *generalialia*, no longer bound to sensible givennesses, "the colors with which every actual is, as it were, painted." This transition from *generalialia* to *universalialia* shows, Heidegger says, *whither Descartes is underway*: there is still a *magis simplex*, and the separation is always carried out under the idea of the rule, *setting back every compositum* (which as such still carries the possibility of an *obscurum*). Hence *Physics, Astronomy, Medicine, and the other disciplines that depend on the consideration of composite things are doubtful, while Arithmetic, Geometry, and the like, which treat only of the simplest and most general things and care little whether they are in the nature of things or not, contain something certain and indubitable*: the *maxime simplices* are evidently those of mathematics, the *simplicissima et maxime generalialia* — *whether I wake or sleep, two and three together are five, and the square has no more than four sides*. Here Descartes has givennesses for which the made-uncertain access-conditions are no longer relevant (the *regula* was, after all, *abstracted from* these objects). And yet Descartes does *not* stop here. Why not at the objects he himself says are absolutely clearly and distinctly given? *Because they cannot give a fundamentum absolutum for the basic science* — for that is the *prima philosophia, ontology in the old sense*: Descartes wants, in the sense of the *regula*, to speak *sentences about being, about being-caused, about the being of God*, which he *cannot* do with mathematical sentences. The sense of the whole consideration goes to the *prima philosophia in the sense of the old metaphysics and has nothing to do with epistemology*. This is the decisive confirmation of §38's thesis. The doubt does not stop at mathematical certainty because Descartes is not after a theory of *knowledge* but after the *fundamentum* of *ontology* — he needs a first being from which to speak of being, causation, and God — so mathematics, certain but not *absolute*, must itself be shaken. The *cogito* is sought as an *ontological*, not an epistemological, foundation.

So this givenness too must be *shaken*: *there is fixed in my mind a certain old opinion, that there is a God who can do all things, and by whom I, such as I am, have been*

created; but how do I know he has not brought it about that there is no earth at all, no heaven, no extended thing, no figure, no magnitude, no place, and yet that all these seem to me to exist just as now? Heidegger stresses that the concrete situation is *co-determined by the conviction of God's being-there*, which has its reflex in the quite determinate *pre-opinion about the sense of being as esse creatum*; so that in all his dealing with being, the conviction of the *esse Dei* stands within it, and the question whether a *deceiver* may have created me is *not* a foreign one but is *given without further ado on the ground of his consideration* and must be taken into account. The deceiving-God hypothesis is thus *not* a sceptical extravagance but follows from Descartes' *creation-ontology*: because being means *created being*, and I am created by an all-powerful God, the possibility that this God deceives is built into the very sense of being Descartes presupposes. *Therefore I must henceforth carefully withhold assent from these no less than from the openly false, if I would find anything certain*; and to be sure even against this uncertainty, Descartes again makes the step from *dubitatio* to *suppositio*: *I shall not do ill if, turning my will wholly to the contrary, I deceive myself and feign for some time that these are altogether false and imaginary*. So he has worked himself to what Heidegger calls the *end-situation*: *I will suppose that heaven, air, earth, colors, figures, sounds, and all external things are nothing but the delusions of dreams; I will consider myself as having no hands; I will remain obstinately fixed in this meditation*. He *places himself before the Nothing* and seeks to *hold himself in this situation* — and this means, with respect to the end-situation itself, that he is placed *not only before the Nothing but in the Nothing* of the possibilities of meeting anything: *my seeking is placed before the Nothing and itself in the Nothing*, characterized as a *being-out-for a certum*. This is the existential heart of the Meditation, and Heidegger reads it with great seriousness. Through the *suppositio falsi* (everything supposed false, hence non-existent) the seeking is brought *before the Nothing* — and, since its own access-possibilities are removed, *into the Nothing* — while remaining a *being-out-for-something* (the certain). The structure is recognizably that of Heidegger's own later analyses (the Nothing of "What is Metaphysics?", the *Angst* that places *Dasein* before the nothing of its possibilities); here it is glimpsed at the founding moment of modern philosophy, though as the product of a *methodical* (and therefore semblance-) radicality.

And then the find: *but it itself still is*, though the way of access to something is denied it; *it still stands in the expectation of something*. The seeking can now *only still meet the being-seeking itself* — and what is found that satisfies the rule is *not the dubitare as such but the being-seeking, which encloses its being in itself*. I find, *before the dubitare*, an *esse*; and the *dubitare* is *cogitare*; so the *esse* is a *sum*. The *esse* of that *res* which I find is a being that *must be expressed by the sum*; what is found is *not the findability of the dubitare as a res but the state of affairs that in the dubitare an esse is co-given*. This

is Heidegger's precise and original reading of the *cogito sum*. What the doubt discovers is not the *dubitare* as a present-at-hand mental act (a *res*), but the *being-seeking* itself — the *esse*, the *sum*, that is *co-given in* the seeking, that "encloses its being in itself" and "still stands in the expectation of something" even before the Nothing. The *sum* is reached as the *being* of the seeker, not as an object of an inference — and this is why Heidegger insists the *cogito sum* is an *ontological* find. But — as §38 warned and §42–45 will press — Descartes immediately covers this find by determining the *ego* that is so found as a *res* (a thing with properties), and so loses the very being (*sum*) he has touched.

§ 42. The caring seeking for the what-character of the ego sum under the guidance of the *regula generalis* in the Second Meditation: the ego cogito

Heidegger follows the further course: *I do not yet sufficiently understand who I am, this I who now necessarily am, and henceforth I must beware lest I rashly take something else in place of myself.* We are to consider how Descartes answers the question of the *what-character* of what he so finds. Descartes admits for the determination of the *ego* only *what satisfies the rule* — only what is so given that it shows itself as a being in the sense of the rule. By what way do I come to determine what this *ego* is? Shall I hold to a *definitio* — a *human being*, but what is that? Shall I say a *rational animal*? No, for then I would have to ask what an animal is and what rational, and so from one question slide into more and harder ones. He holds *not* to definitions but to *what is given in natural Dasein-consideration: what spontaneously and with nature as guide occurred to my thought whenever I considered what I was.* And so he repeats the consideration: *first it occurred that I have a face, hands, arms, and this whole machine of members, such as is seen also in a corpse, which I designated by the name body.* Heidegger marks the decisive point: *Descartes sees his own being-there as a thing with determinate properties, in the categorial determinations of a given thing with properties.* This is the ontological error that Part Three will name. Descartes interrogates *himself* — his own *Dasein* — with the categories of a *present-at-hand thing* (a body with members, "such as is seen in a corpse"), so that from the start the *being* of the self is sought as the being of a *res*. He then peels away what is *not* given in the sense of the rule (everything in any way sense-determined, containing an *obscurum*), so that for the *what* of the *ego* only such givennesses come into question as came into question for the *that*. The question *quid sum?* is settled by Descartes' answer *sum res cogitans*; and *what is this?* — *a doubting, understanding, affirming, denying, willing, unwilling, also imagining and sensing thing.* Even *sentire* is now taken into the *what-determination* of the *ego*, because Descartes has pressed to a sharper determination of *sentire* as an *animadvertere* as such, in which the *mediation through the senses* becomes irrelevant: *I see light, hear noise, feel heat; these are false, for I am dreaming. But surely I seem to see, to hear, to grow warm — and it cannot be that, when I see, or (what I no longer*

distinguish) when I think that I see, I who think am not something. Seeing, hearing, smelling are now *reinterpreted* into a *cogito me videre, videor videre*: I have myself along when I see, I am co-given to myself — so that *sentire* is ultimately also a *cogitatio*, only subsequently co-determined by the organs; and into the determination of the *ego* falls only what has the character of the *res cogitans*. The crucial move is the reduction of *sensing* to *thinking-that-I-sense*: the lived perceiving of the world (light, noise, heat) is re-aimed onto the *self-having* of the *cogitare* ("I seem to see," "I think that I see"), so that the whole of perceptual life is absorbed into the *res cogitans* — and the world, again, is left out. The *self-having* (the "I have myself along when I see") is the genuine phenomenon Descartes touches; but he reads it as the mark of the *res cogitans* rather than as a structure of *being-in-the-world*.

§ 43. The valid proposition in the character of universal-bindingness as the found of the care of certainty

The decisive question, Heidegger says, is how, from the manner of the *that-* and *what-*determinations of the *res cogitans*, it becomes visible *what for Descartes was properly the sought and the found*; and by interpreting the *formulae* for the *cogito sum* we are to see how Descartes *formulates* the find and as *what* he claims it. In the direction of the seeking, Descartes performs *dubitationes, suppositiones, remotiones*; the seeking of the *res cogitans* and the determination of its being is oriented at the *horizon of the givenness of his own being-there* — before the stove, with the paper in hand, in his clothing. The critical consideration always attunes itself to the *principles*, the *access-modes* to the beings known to Descartes; these fall to the *remotio*, first what is so given, then, in regress to the *being-conditions* of this knowing, the *grasping-modes* (the waking grasping-mode, co-conditioned by my physiological being, staying irrelevant). Descartes closes with a thoroughgoing *fallam me ipsum*, I will deceive myself, and characterizes the end-situation: *I will remain obstinately fixed in this meditation; and I will proceed until I know something certain, or, if nothing else, at least this very thing for certain, that there is nothing certain.*

Heidegger lays out the *structure of the end-situation*: the *being-placed before the Nothing of givennesses*; the *being-placed in the Nothing of the possibilities of access* (so that one can no longer be seekingly out for something); and the seeking, so placed in and before the Nothing, *doubly characterized* — by its *being-out-for something* (a *fundamentum absolutum et simplex*, the determinate being-out character of the seeking as seeking) and by a *determinate horizon* from which something like a *certum* can encounter at all. This horizon, too, is determined from the way taken: it is the *horizon upon my own being-there*, which now more and more falls to the *remotio*; the *expectation-direction has stayed, and it goes upon myself*. This must be kept in view to understand that the *turn of the dubitare upon itself* has nothing *violent* but lies in the

tendency of the seeking: the seeking is pressed to the leap of seeing itself. The crucial structural insight is that the *cogito* is reached not by an inference but by the seeking being *driven back upon itself*: once every other access is removed, the expectation that constitutes the seeking can fall only on the seeker, so the *dubitare meets the dubitare*. The seeking interrogates what meets it — *are you a certum?* — and *what meets me in the dubitare is the me dubitare, and the me dubitare shows itself as me esse: is that a certum?* Yes — *cogito sum*. So the *dubitare* is found as *me dubitare, me esse*.

Descartes then determines the found in its *What*, taking only what satisfies the rule (*me velle, me affirmare, me dubitare*), so that *quis sum? Res cogitans*. Heidegger stresses what is and is *not* at stake: it matters to Descartes to *delimit and determine the regional stock of the cogitatio*, but it *cannot* lie in his intention, in the *what*-determination of the *ego*, to show that the *ego* designates the *unity of a manifold* — "this opinion guides the whole translation of Buchenau." The question of the *unity of a manifold* is *no problem at all* for Descartes; he asks what belongs in the *regional connection of the res cogitans*, and determines the *what* of the found from that. So the *that*-being and the *what*-being of the *res cogitans* are determined.

And now the decisive ontological result. We must ask, Heidegger says, *what it is that Descartes found, and what he himself claims to have found with the cogito ergo sum* — is the found a *certum*, and in what sense? *The found is an aliquid not qua res*: not the *dubitare* as such, not the *esse* of the *dubitare*, but *me dubitare, me esse* — *that my being-doubting is my being*. What is found is *not aliquid qua res but aliquid qua Sachverhalt*, a state of affairs; the basic find of the seeking is a *veritas*, a *proposition* spoken with regard to the objective — *not* an object as such (the *dubitare* or the *ego*) but a *stock*, the stock of a *state of affairs*: that the *me dubitare is in the me esse*, the *co-givenness of the esse in the dubitare*. This stock is taken up into the proposition *cogito ergo sum*; and so one can say briefly: *what satisfies the sought certum is not a res but a proposition, a validity (Gültigkeit)*. The care of certainty *seeks and finds a validity in the character of universal-bindingness*; and since with Descartes the care of cognition tips into the interpretation of *verum* as *certum*, the basic find is correspondingly *not a res but a veritas, a certain proposition*. This is the culminating result of the whole Descartes-interpretation and the immediate ground of Part Three. What the founding act of modern philosophy actually yields is *not* the *being* of the self (the *sum* as a way of being) but a *valid proposition (cogito ergo sum)* — a *Gültigkeit* in the character of universal-bindingness. The *certum* sought is a *truth-of-a-proposition*, not the being of a being; so at the very moment the self's being (*sum*) is touched (§41), it is converted into the *validity of a sentence about the self* — and the *being* of the *res cogitans* is thereby *passed over*. The conversion of *verum* into *certum* culminates in the conversion of the *sum* into a *Gültigkeit*.

Heidegger announces the proof (to come through the formulations) that this is indeed the *sought* and that the *veritas as veritas* satisfies it, and adds the point needed to understand the transition from seeking to finding: *the seeking itself has a quite determinate determinatio*, which it gets by *bringing itself into the end-situation*. He cites Descartes: *when I examined these days whether anything exists in the world, and noticed that from this very fact, that I examined it, it evidently follows that I exist, I could not but judge that what I so clearly understood was true — not because I was compelled to it by any external force, but because from a great light in the intellect a great inclination in the will followed*. From the end-situation, where every possibility of an *obscurum* vanished, *followed the inclination in the judicare*, the assenting to the given; and this assent was *neither forced nor from an indeterminate situation: so much the more spontaneously and freely did I believe it, the less I was indifferent toward it*. Heidegger reads this precisely: *my situation was one of tense expectation; the less indifferent it was, the more my propensio was determined* — through the process of the *remotio* the seeking *temporalizes in itself the determinate determination in certum as fundamentum absolutum*. This specific *determinatio* must be made present to see the *snapping-shut* (*Einschnappen*) of the seeking onto the *being-seeking itself*. The point closes the circle with §27–28 and §34: the "freedom" and "spontaneity" of the assent to the *cogito* are the *determinatio in bonum qua certum* (the will inclining the more freely the less indifferent it is); the end-situation is a *tense expectation* in which the *propensio* is maximally determined; and the *cogito* is reached by the seeking *snapping shut* on itself — a determinate *movedness* of the will-to-certainty, not a neutral self-evidence. With this, Part Two closes: the care for known knowledge, traced into its historical concretion in Descartes and behind him into scholastic ontology, has disclosed *consciousness* (the *res cogitans*) in the being-character of *certum esse*, and has yielded, as its "absolute foundation," not the *being* of the self but a *valid proposition* — so that the *question of the being of the res cogitans* has been, from the start, *passed over*. The demonstration of this omission, and the counter-exhibition of *Dasein*, is the task of the Third Part.

DRITTER TEIL: Demonstration of the omission of the question of being as exhibition of Dasein

Chapter One: The obstruction of the question of the specific being of the *res cogitans* by the care of certainty

§ 44. Descartes' perversion of the having-oneself-along into a formal-ontological proposition

That today's epistemology, in a peculiar opposition to Aristotle, at the same time *confesses to the truth-idea in the sense of validity*, lies — Heidegger says — in the *unified origin of this discipline in Descartes*. This orientation led, on the one hand, to *putting oneself in the impossibility of understanding at all what Aristotle understood by truth*, and on the other to the *modification of this being into the certum*. The roots of these connections lie in Descartes; and therefore the consideration of this tip from *verum* into *certum* is important not only for our question of the being-character of consciousness, but also because *the orientation of today's philosophy at consciousness is driven into fundamental impossibilities* — the impossibility of being able to grasp such phenomena as *spirit*, *life* (which are always set on consciousness), insofar as one approaches these phenomena *with determinate categories*. Heidegger thus states the stakes of the whole Third Part: the modern inability to grasp *life* and *spirit* (the inability of *Lebensphilosophie* of §18, of psychology of §8) is a consequence of the Cartesian conversion of *truth* into *validity* and *consciousness* into a *certum* — so the diagnosis of Descartes is at once the diagnosis of the contemporary impasse.

The tip of *verum* into *certum*, Heidegger says, means *the transposition of consciousness into the categorial sphere of the formal-ontological*. This transposition has the peculiarity that *one believes oneself assured of a sphere that is certain, while being unable to interrogate the sphere as to its being-character*. The pregnant expression of this is in Descartes, insofar as *he takes the cogitare not in the sense of a found thing but cares to have found a certain proposition*: the *cogito*-proposition has for Descartes the character of a *formal-logical proposition* valid of *this thing* — what we can briefly characterize as the *Denkding*, the thought-thing — a *mathematical formalization tied to a determinate condition*; otherwise the *cogitatio*, as to its *structure-character*, is *not relevant*; it is enough that the *Denkding* yields the possibility of this proposition. This is the precise statement of the Cartesian omission. Descartes secures a *certain* sphere (the *res cogitans*) but is constitutively unable to ask after its *being*, because what he wanted was a *valid proposition*, not a seen being — so the *cogitatio*'s own structure is irrelevant to him, a mere "thought-thing" sufficient to ground a formal sentence.

Heidegger then turns positive. If what is found in the end-situation is a *proposition*, a state of affairs put into a proposition, *how does it stand with the matter itself that yields this state of affairs?* The state of affairs cannot be *thought up*; if the result of finding is a *Verhalt*, the *matter* that yields the *Verhalt* must still be *sightable* — there must be a *matter-motive* for the creation of this *Verhalt* out of the matter itself, the matter must in some sense be seen. So the positive question arises: *how does Descartes come to the formulation of this state of affairs as a formal-ontological one? What did he find that gives him the right to mark off this Verhalt so?* And the key: how does Descartes determine the *res cogitans* at the very place where he ultimately *takes imaginari and sentire into it* — what is the characteristic of the *res cogitans* that *sentire* and *imaginari*

must satisfy to be taken in, the *regional character* of *cogitatio* that justifies it? On the doubt-way both *sentire* and *imaginari* had met him, but he had *switched them off* (because they met under the condition of waking and dreaming); toward the end he takes both *back into* the *res cogitans*. What is the peculiar thing that puts even *sentire* and *imaginari* in the aptitude *ultimately to be "cogito"*?

The decision is given at the close of the Second Meditation: *it can be that what I see is not truly wax, it can be that I do not even have eyes by which anything is seen; but it cannot be that, when I see, or (what I no longer distinguish) when I think that I see, I who think am not something*. Here, Heidegger says, *cum videam* is equated with *cum me videre cogitem*; Descartes sees the connection thus: *jam non* — now, where it matters to him to transpose the *videre* into the *res cogitans* — *sentire* equals *cogitare me sentire*, and *cogitare* equals *cogitare me cogitare*. So Descartes in advance grasps the *cogitare* thus: a peculiar being that is in the manner of the *Wie* of the *having-oneself-along* (*Sich-mit-haben*), that, being in its way, at once has itself along. In this basic determination a phenomenon is enclosed that Descartes does not expressly fix: *cogito* does not simply mean "I establish something that thinks," but a *cogitare* such that *I myself have this being along*. Later this was called self-consciousness, inner consciousness, *accompanying* every act of consciousness — but, Heidegger insists, the very talk of "accompanying" does not hit the actual state of affairs: the being of the *cogitare* is a *having-oneself-along*. Precisely because it belongs to the being of *cogitare* to be *had along by itself* in a peculiar way, Descartes can say *is qui cogitat, non potest non existere dum cogitat* (he who thinks cannot not exist while he thinks). This is the genuine phenomenon Descartes saw — and the place where Heidegger most clearly credits him. The *cogito* is not a thing that thinks plus an added inner observation of it; it is a being whose very being is a *having-itself-along* (*Sich-mit-haben*) — the self is *given to itself* in its comportment, not *alongside* it. The later language of "self-consciousness accompanying every act" *falsifies* this, because "accompanying" makes the self-having an added second act rather than a structure of the being itself. This *Sich-mit-haben* is the seed of the *Jemeinigkeit* (in-each-case-mineness) and the self-disclosure of *Dasein* in *Sein und Zeit*.

But — and here is the *Verkehrung*, the perversion — *because Descartes at once takes this phenomenon in the res cogitans itself as ground, in order to make from this relation a formal-ontological absolute relation* (since he cares in advance for such a proposition), he takes this connection as an *occasion* for marking off a *formal-ontological proposition*; and *this proposition, in the moment one takes its content in a formal-ontological sense, is no longer object-hitting (gegenstandstriftig)*. Precisely by taking the *state of affairs* as the *occasion for a formal proposition*, Descartes perverts the specific being of what he had previously seen: the phenomenon of the *having-oneself-along*. This is the central thesis of §44 and the hinge of the whole lecture's verdict on Descartes. Descartes

glimpsed the genuine phenomenon (the self's having-itself-along) but immediately *converted* it into a *formal-ontological proposition* (*cogito ergo sum*, *I think therefore I am*), and the moment it is taken as such a formal sentence it *no longer reaches the matter* — so the founding insight of modern philosophy is at once the *perversion* of the very being it touched.

Heidegger indicates the right use of the sentence. Taken instead as a *formal indication* (*formale Anzeige*) — so that it is *not* taken *directly* (where it says nothing) but *related to the respective concretion* of what it means each time — the sentence *has its right*. *To the being of the cogitatio belongs the character of Jeweiligkeit*, in-each-case-ness; *every being in the sense of Dasein is characterized by its Jeweiligkeit*, and further *determined by its Zeitlichkeit* (temporality), and further by the *specific kind of being of this ego sum in what it has*. (Descartes, moreover, leaves the whole state of affairs of the *cogitatum* out of consideration.) This is one of the most important methodological passages of the lecture. The *cogito sum* is salvageable, but only as a *formale Anzeige* — a formal indication that points to, and must be filled in by, the *concrete, in-each-case* existing of a particular *Dasein* — not as a formal-ontological proposition with a fixed content. And the being of the self is named in its proper structures: *Jeweiligkeit* (the in-each-case-mineness that *Sein und Zeit* will call *Jemeinigkeit*), *Zeitlichkeit* (temporality), and the relation of the *ego sum* to "what it has" (its world, the *cogitatum* Descartes drops). The *formale Anzeige* is Heidegger's own method, here named: concepts of *Dasein* are not universals subsuming instances but indications to be enacted in each case.

He underscores the upshot for the *sum*. Descartes takes the proposition from a determinate *phenomenal stock*, the *res* is *set into a state of affairs*, so that it comes down to *the being of the certum as veritas*; *with the validity he never hits the res again*, which now comes into consideration only *secondarily*, as to its respective manifold. *The sense of the sum is emptied to the sense of formal-ontological something-being*; and therefore the formulation *adequate* to Descartes is precisely *sum res cogitans*, I am a *thought-thing* — for he himself says he *can and will assert nothing about the "I" and "am,"* because the *being-question* with respect to the specific being of the *res cogitans* concerns him *only secondarily*. This is the precise locus of the omission. The *sum* — which in §41 was reached as the self's *being* — is *emptied* into "formal-ontological something-being," so that "I am a thought-thing" is the *honest* Cartesian formula: Descartes deliberately says *nothing* about the "I" and the "am" as ways of *being*, because the being-question is secondary to the care for the certain proposition. The being of the self is not denied but *passed over*.

This attitude on the *cogito*, Heidegger adds, Descartes secured by a *heaping of conditions* under which he placed the seeking; one must keep in view that this *seeking*

doubt is not something indeterminate and general but *rests in a quite determinate conception of the cogito*, placed under quite determinate conditions, so that *only the quite determinate has the aptitude to meet this seeking, and all else falls to remotio*. And he gives an example of how this structure matters: how Descartes, *with the first find, at once co-finds the criterion* of this finding — *I am certain that I am a thinking thing; do I not then also know what is required for me to be certain of something? Surely in this first cognition there is nothing other than a certain clear and distinct perception of what I affirm*. This first *finding cogitare* is *not only a having-something-along but at once a cognitio* in the sense of the *clear and distinct being-illuminated about the having-along itself*, so that it *co-sees itself in the seen*. It is, Heidegger notes, *the same phenomenon already seen in Thomas (De veritate, art. 9)*, where Thomas makes clear the difference of *intellectus* and *sensus* — that in the various *facultates animae* a different possibility of a *reditio*, a returning-upon-itself, shows itself, limited at the *sensus* but complete at the *intellectus* (from the *Liber de causis*, going back to Aristotle). So the *self-illumination* of the *cogito* (its co-finding of its own criterion) is the *reditio completa* of §31 — the scholastic self-return of the intellectual substance — confirming once more that the Cartesian self-consciousness is a medieval inheritance, now perverted into the formal *cogito*-proposition.

§ 45. Summarizing characterization of the *res cogitans* found by Descartes: obstructing the access-possibility to the genuine being of the *res cogitans*

Heidegger gathers the result in six points. *First*, the being-predication with respect to the *res cogitans* is *esse certum* and only this. *Second*, it lies *from the beginning not in the tendency* of the seeking and of the determination of the *cogitare* to interrogate it as to its *specific being* at all; the posing of this being-question lies *not* in the task of Descartes' research, *although he afterward claims this formal being as the absolute being*. *Third*, the research-tendency not only did not pose this task, but *this seeking is precisely what blocks in advance the possible way of determining this being* — it *obstructs the possibility that the matter is given in itself with respect to its specific being*; rather, *this being of the res cogitans must, as it were, set back the specific being in order to become formal and to come as a mere something into the proposition*. These three points fix the omission as *structural*, not accidental: the care for certainty *cannot* ask after the being of the self, because to become the certain *fundamentum* the self must be *emptied* of its specific being and reduced to a formal "something" in a valid proposition — and yet Descartes then *claims* this formal being as the *absolute* being, the master-concept of his ontology.

Fourth, what is taken into consideration as *being-determinations of the res cogitans* stems from *traditional ontology*, and indeed from one that was *primarily not oriented at all at this being-connection of the res cogitans as such*. *Fifth*, this traditional ontology no

longer has what it fundamentally takes as foundation in its *originariness* but already in a quite determinate *reformation*, shown most clearly in that *esse* says nothing other than *esse creatum* — wherein it is enclosed that *the being of God, just like the being of the created, is categorially grasped in the same sense as esse creatum*, God being only the *causa prima et absoluta* of the *esse creatum*. And here Heidegger sounds the deepest note of the regress. If one looks at this ontological basic-determination *on its origin*, one comes to see that the *ὄν* ultimately means *ὄν ποιούμενον* — *not* being-created in the sense of *creatum esse* by God, but *being-produced as a phenomenon of concrete being-there*; the *esse creatum* oversteps its limits insofar as it is taken *beyond the being of the world*. This is the culminating genealogical thesis of the lecture, and the deepest layer of the *Destruktion*. The medieval *esse creatum* (created being) is itself a *theologizing* of the Greek *ὄν ποιούμενον* — being in the sense of the *produced*, the made (the οὐσία-as-*Hergestelltsein*, being-produced, that §3 and §33 tracked in the πράγματα of concerned dealing) — so that the whole inherited sense of *being* is *being-produced*, drawn from the phenomenon of *making* within concrete *Dasein* and then *overextended* (illegitimately) beyond the world to God and to the self. And because God's being (as *actus purus*) is itself taken up into this *indifferent* being-as-*esse-creatum*, there is for Descartes *in advance no inhibition* to claiming this very being, without further ado, for the *res cogitans*. The being of the self is thus determined by a *making-ontology* (being = produced/created) that has *no original relation* to the self at all.

Sixth, one can therefore say that this kind of determining the *res cogitans* as *esse creatum* not only does not pose the question and *obstructs the access-possibility to the genuine being of the res cogitans*, but that *this seeking and finding temporalizes in itself a quite determinate Unbedürftigkeit* — a needlessness, an in-need-lessness — *of asking after the being of the res cogitans*. The priority of being-predication has the *certum esse*, and *every further being-question is determined and led by it*. This is the final formula of the omission and the precise sense of the Third Part's title. The care of certainty does not merely *fail* to ask after the being of the self; it *produces a positive needlessness* of asking — a self-satisfied closure (the *Beruhigung* of §38) in which *certum esse* has become the measure of all being-questions, so that the genuine being of the self can no longer even *appear* as a question. The way to *Dasein* is *barred*; and the task of the chapters to come is to break that closure — to show, against the inherited making-ontology and the *certum*, the genuine being of the self as *Dasein*, *being-in-a-world*, whose being is *care*, *temporality*, and *uncoveredness*.

Chapter Two: Descartes' questioning after the certain-being of the *res cogitans* and the in-determination of the being-character of consciousness as the thematic field of Husserl's phenomenology

Heidegger is now set the last task: to see how the whole questioning after the being of the *res cogitans*, and its answering, *hangs together with the determination or in-determination of the being-character of consciousness as the thematic field of phenomenology*. The chapter draws Husserl back into the result of the Descartes-interpretation — but with great care to do justice to what is genuinely *new* in Husserl.

§ 46. Descartes and Husserl: fundamental differences

In considering the relation of Husserl's work to Descartes, Heidegger warns, *one must not hold to external analogies*; one would thereby give away the proper means of understanding what Husserl wants, and it would be *mistaken to identify Husserl's doctrine with Descartes'*. It must be stressed in advance that there is a *fundamental difference* in *how Husserl content-wise grasps consciousness*, but that precisely *with regard to the disposal of the being-question of consciousness and to the sense of the esse certum*, *Husserl moves wholly in Descartes' sense* — indeed today more than ever wants, in this sense, to go *beyond* Descartes, to grasp the matter quite absolutely. Two negatives govern the comparison: that the *being-region of consciousness is posited as absolute without the being itself being interrogated in another sense than in the question of absolute certain-being*; and the *sense of certain-being*, the *phenomenon of evidence*, as Husserl grasps it — and grasps it *much more sharply than all before him*. These two — the positing of consciousness as an absolute being-region, and the idea of evidence — frame the question how far the thematic field is determined with a view to the role ascribed to it: to give the ground for all further philosophical problematic and ultimately to decide the basic problem of *reason*. The opening is scrupulously fair: Husserl is *not* Descartes content-wise, and his concept of evidence is the sharpest yet; the critique will fall *only* on the *disposal of the being-question* and the *esse certum* — the immanent critique at its most disciplined.

Heidegger recapitulates the positive Cartesian find: Descartes grasped the moment that *every cogitare is at once a cogitare me cogitare*, and that this is a *constituting* moment, shown in its being the *regulative* moment deciding the inclusion or exclusion of *sentire* and *imaginari* in the region of the *res cogitans*. From this it is clear: *the being of the res cogitans is a being that consists in having-itself-along in its being*; and this givenness at the *cogitare* is for Descartes the *fundamentum* for raising the determinate *Verhalt* at the matter so seen. But the *state of affairs* that enters the proposition *is qui cogitat, non potest non existere dum cogitat* is, with regard to its being, *not determined by the res* but *by the sense of the certum*; and the proposition itself stands under the *principle of contradiction*, which is a rule about the *co-subsistence of propositions* — a norm, moreover, of only *limited validity*: the principle of contradiction does *not* hold absolutely but for a quite determinate *regional* connection, not even for the formal-ontological as

such of pure something-relations, but only for *pure positednesses*, things still more formal than the "somethings." Heidegger touches this point to indicate that *even this orientation of absolute evidence is not enough for a radical consideration*. The *cogito sum* is the find in the character of the *fundamentum absolutum simplex*, at which Descartes *tranquilizes* himself; from this being-character as a content-proposition the being-sense of the *res cogitans* is determined, and the *being-question of the res cogitans is once and for all disposed of* — it no longer comes into question, because for Descartes it is now only a matter of getting, from this *fundamentum*, by way of the *deductio*, to further propositions about being-connections. The being-ground is the *esse certum*, and the research-tendency is in advance such that *it is not in its intention to pose a being-question* — to free what it asks so that it speaks from its own being-character. What is sought can come into question only as satisfying the sense of being held before it: *esse certum*. And the being-categories at work are *traditionally taken over*, not held needful of questioning, in a form already removed from their origin, oriented and interpreted at *other* matter-connections — *Christianity*. The tendency alive in Descartes is the tendency toward the *grounding of sciences*, the forming of *ever new disciplines*, which becomes a characteristic moment of intellectual history since Descartes (today *heightened into the grotesque*): *primarily science and its possible erection is in question, secondarily the being of what is treated*, so that the concept of being comes to the determination *being equals possible domain-being for treatment by a science — a being-concept that is in fact decisive for Husserl*. This last is the bridge to the whole chapter. The deepest thing Husserl shares with Descartes is not a doctrine but a *concept of being*: being as *the possible object-domain of a science* — and this is what the comparison will trace.

Heidegger fixes the five viewpoints of the comparison: the relation of the *doubt-way* to what Husserl calls *reduction*; the relation between the thematic positing of the *cogito* (Descartes) and of *consciousness* (Husserl); the question of the character of the *absolute* with respect to the *res cogitans* and the sense of the *absoluteness of pure consciousness*; the connection of the being-character of the *res cogitans* as an *esse creatum* with the fundamental being-determination of pure consciousness as an *ens regionale*; and the *last motivating connection* of Descartes' research and the last-deciding tendencies of phenomenology. The method, he says, is each time first to get clear about the *fundamental difference* of the two positions, and *from there* to see how, *despite* the difference, a *commonality* subsists in decisive connections — so that it shows how *Husserl nonetheless stands in the unified basic tendency of Descartes' research*, the care of cognition as care of certainty being ultimately alive in him.

a) Descartes' doubt-way (remotio) and Husserl's reduction

At first sight, Heidegger grants, both ways have something common — so much that one could almost say the *reduction is at bottom the same as the remotio*: both are at home in the same region of departure (Husserl, like Descartes, starts from the "I in my environment"); the *goal* seems the same (to press through to the *cogito* as *absolutum*); and the *manner* of going is the same, both carried out as a *switching-off* (Descartes as *remotio*, Husserl as *reduction*) — a coincidence Husserl himself supports by expressly referring to Descartes' doubt. But closer seen, *fundamental differences* show themselves. As to the *goal*: Descartes wants an *absolutum* such that from it all further sciences become *groundable and erectable* — the *fundamentum* as the starting-point for determinate proof-series. For Husserl it is *not* a matter of winning a *fundamentum for all sciences*, but of *finding a science itself, a new science* that does *not* take the *fundamentum* as a starting-point but makes the *fundamentum itself the theme* of this science — *the fundamentum not as the "from-where" of a proceeding but as the "about-which" of a science*. This means Husserl takes a *wholly different stance toward all the sciences*, and the *sense of switching-off* in the *remotio* is fundamentally other. In Descartes it is a *switching-off and putting-away* of determinate being-connections and the correlative grasping-modes *because they do not satisfy the regula generalis* — the sciences seen as *uncertain*, the graspable subject to deception. For Husserl the sciences are *not put away but put alongside*, taken up into the sought fundamental-theme: the *reduction* has the *positive* sense of bringing the sciences and what is grasped in them *into the thematic region of the new science*, the positive task of *not critiquing beings on certainty and uncertainty but setting them in the thematic aptitude to become workable in the sought science*. This is the decisive corrective Heidegger insists on (already flagged in §41). The *reduction is not the remotio*: the *remotio* destroys (posits the doubtful as non-being), the *reduction* preserves (brackets the being-positing so as to make the whole of being *thematically* available). They look alike and start alike, but their *sense* is opposite.

Accordingly the *departure* of the two ways differs at its root. Descartes' orientation about his environment happens *in the light of the critical question whether it is a certum*; in Husserl the *opposite* tendency is alive — *not* to shake this environment, to discover darkneses, but precisely *to see it itself in its original givenness and to co-see my comportment to it*. (Whether Husserl, in the way he carries out the consideration of the environment, *can* see it at all, is secondary.) The positive tendency is: *not to shake but to provide the being for a possibility of interrogating it anew* in the sense of the new science to be constituted. So the *reduction does not have the sense of leading into an end-situation* as in Descartes — such that the seeking sees itself placed *before the Nothing and in the Nothing* of the possibilities of finding; rather, *the reduction forms the possibility that all merely possible being comes into view* — so *not nothing, but the totality of being* is to become thematically present in a determinate modification. The

contrast is sharp and important: where Descartes' doubt empties the world toward the Nothing (to extract a single certain point), Husserl's reduction *opens* the whole of being as a field of investigation (under the modification of the *epoché*) — which is exactly why Heidegger can credit Husserl with the *positive* recovery of the world's givenness even while charging him with leaving its *being* undetermined.

b) Descartes' cogito and Husserl's consciousness

From the difference of the ways it is already evident that the *cogito* is seen otherwise by Descartes than by Husserl. Descartes interrogates the *cogito*, in the starting-position "my being," *as to whether it is a certum*, a *res* satisfying the *regula generalis*. Husserl, by contrast, interrogates the *cogito* *not* as to whether it satisfies a norm but *sees it positively*: he seeks positively a *basic structure* and sees it in what he designates as *Intentionality*. He sees consciousness *positively* with regard to this decisive structure-moment — and this, Heidegger says, has an *incisive* significance for the whole further problematic of consciousness: *the intentionality of consciousness is not some state of the ego, but in this "directing-itself-at" the Whereupon of the being-directed is co-given*. Intentionality is *not* to be considered as a *peculiarity of psychic processes* but is to be given as a *way in which something encounters*, such that *what encounters comes into view with the encountering*: the *directing-itself-at in one with its specific Whereupon*. This is the fundamental sense of what is meant by intentionality from the start — so that *in the attitude, with the cogitare in one, the cogitatum is given as the being in the how of its respective encountering for the access and dealing itself*. And then Heidegger pays Husserl the highest compliment of the lecture: *with this discovery of intentionality, for the first time in the whole history of philosophy the way for a radical ontological research is expressly given*. This is the decisive counterweight to the entire critique. Intentionality — rightly understood, *not* as a property of inner psychic states but as the structure of *being-directed-at-something* in which the *thing itself*, in its mode of encountering, is *co-given* — is the *opening of ontology as such*, because it lets beings be seen *in their being* (the how of their encountering). Heidegger's own being-in-the-world is the radicalization of *this* discovery; the immanent critique is the critique of a friend who owes everything to the breakthrough he is correcting.

Brentano and scholasticism, Heidegger continues, still move in *fundamental blurrings and confusions* of the problems; *Husserl has positively seen something fundamentally new*, which is why research that makes consciousness in this basic character its theme is *fundamentally superior* to a direction often grouped with phenomenology — the *Austrian theory of objects* (*Gegenstandstheorie*, Meinong), which *never got beyond a quite primitive level of consideration*. Brentano *never understood what is really at issue* and held only to the trivial distinction between *object and grasping*; the Austrian school

has today *wholly degenerated into logistics* and become powerless, its fate showing that it did *not understand the necessity of an ontology*, became an *empty calculus of relations and relation-connections*, and grew blind to concrete being-connections. The polemic sharpens the praise: what makes phenomenology superior to its rivals (Brentano's psychology, Meinong's object-theory, the logistics of the day) is precisely that intentionality opens *ontology*, the question of *being*, which the others reduce to a calculus of relations — so the very thing Heidegger demands (the being-question) is what Husserl's discovery first makes possible.

The division between Husserl and Descartes shows precisely in *what each makes of the phenomenal find cogito me cogitare*. For Descartes the fundamental find becomes merely the *ground for marking off a formal-ontological proposition* that satisfies the *certum* and becomes a starting-point for propositions of the *same validity-character*, not necessarily related to the being of consciousness; it does not matter to him to take the *res cogitans thematically*. For Husserl, by contrast, this peculiar phenomenon of *conscious self-relating* becomes the starting-point of a *fundamental grasp of reflection* — the fact of reflection *not* as the *fundamentum of a formal-ontological proposition* but as the *instrument* for forming the proper consideration-way: "*the phenomenological method moves throughout in acts of reflection*." And one must note over *what* the reflection goes: over *consciousness with the basic character of intentionality* — the reflection goes *not over psychic processes but over the way of comporting to the objective world*. It is therefore, Heidegger insists, a *fundamental aberration* to characterize Husserl's phenomenology as an *act-phenomenology* or a *transcendental psychology*, as Scheler does; to do so one would have to take the concept of "act" otherwise than Husserl wants it understood. Phenomenology directs itself precisely *not at acts in the old sense* but at the *wholly new domain* — the *way of self-relating*, such that the *Whereupon of the self-relating is present*. Without this ground, Heidegger says, *I am in no position ever, in the direct consideration of beings, to see anything like a being-character, indeed to do anything like ontology*; and so he returns to the thesis that here, *for the first time in the history of philosophy, the ground for an ontological research is exhibited*, such that one can *take steps in the manner of scientific inquiry and not in the form of mere reflection*. The defense of Husserl against Scheler is also a self-defense: phenomenology is not a psychology of inner acts but the science of *comportment-to-world*, and only on its ground can being-characters be seen — so Heidegger's own ontology is the legitimate heir of Husserl's reflection, against the psychologizing (Scheler) and logicizing (Meinong) misreadings.

c) Descartes' absolutum of the res cogitans and Husserl's absoluteness of pure consciousness

The *absolutum* in Descartes, Heidegger says, means nothing other than the *fundamentum simplex* for the *start of the deduction*; "relative" means, in Descartes, all

that is *deduced*, that does not stand at the first place in the grounding-connection. "Relative" for Husserl, by contrast, means *to be a being that announces itself in consciousness*, that has *in consciousness the possibility of showing itself of itself*, and accordingly *consciousness as the absolute being* means *that being in which every possible other being announces itself, which has in consciousness the possibility of showing itself of itself*. This is the sense of consciousness striven for in Husserl. (That, in the contemporary milieu, phenomenology re-formed itself into a *reason-science* is a secondary question that does not interest us here, where it comes down to *understanding phenomenology as a possibility and developing it further* — and one can develop it further *only by going back to its life-strong roots*.) Heidegger underlines: the *determination of intentionality first makes the phenomenological research-method possible*, which is possible when *with the reflection the act reflected-on is present* — the Whereupon being *not the natural object but the object in the how of its being-meant*. A table, to use a trivial example, is taken into the problem-field of phenomenology *not* as this specific object but such that it is set into consideration *in the how of its being-an-object*: not the table with regard to its experienceability is present, but *the character of its being-real* is present, which belongs within the region of the phenomenological analysis itself. So the third difference, the determination of the *absolute*, is clearest via the *relativum*. The *cogito* is *fundamentum absolutum simplex* insofar as it is the *starting-point for the further deduction*, the *fundamentum* for all possible objects as the *start of the proof*, for Husserl, *consciousness is not the starting-point for a proof-chain but is itself absolutum in the sense of a distinguished being-region*. In the *absolutum* lies the character of *the domain of objects that, on the ground of their unique content, fill this domain*; so for Descartes the *cogito* is merely the *first approach* for establishing and marking off a formal-ontological proposition, while for Husserl it is *not* a matter of finding an *absolutely certain* from which other things could be deduced — rather *this fundamentum is itself the theme of a science: not looked away from toward other things, but the fundamentum is the absolute theme*. The difference is real and to Husserl's credit: where Descartes' *absolutum* is a *point* to deduce *from*, Husserl's is a *region* to investigate *into* — consciousness made the *theme* rather than the *premise*. And yet (the chapter will show) the very conception of this region as the *absolute being in which all being announces itself* carries the Cartesian inheritance: consciousness is the *measure* of being, the field in which alone beings may show themselves.

d) Descartes' *res cogitans* as *ens creatum* and Husserl's pure consciousness as *ens regionale*

This difference becomes still clearer, Heidegger says, at the fourth moment, the inquiry after the *being-character*. The *res cogitans* is determined as *esse creatum*; in the *esse creatum* the *esse verum* is co-given, and this falls, in Descartes, to a *tip into esse certum* — so the being of the *res cogitans* grounds ultimately in a being of the character

esse creatum. Consciousness as absolute consciousness is determined by the being-character of being a possible region for a science, an *ens regionale*. The division between consciousness and the being that announces itself in consciousness is, according to Husserl, the *proto-division of all category-doctrine*: being as consciousness is that wherein all transcendent being is in some sense there — consciousness, taken in the sense of the fundamental structure of intentionality, is a possible being-region in which every transcendent being as such announces itself and becomes findable, and Husserl lays this distinction at the ground of all further being-consideration. Heidegger fixes the decisive point: *being as consciousness is in advance posited as that being which gives a subject-domain for the fundamental science underlying all other sciences and "grounding" them in a peculiar way*. The sense of being as being a possible object of a science he reserves to bring nearer by tracing this being-determination and its motive back to the care of certainty that led to the being-determination, or non-determination, of the *res cogitans*. This is the precise locus of the commonality beneath the difference. Descartes determines the self's being as *esse creatum* (a region of the making-ontology); Husserl determines consciousness as *ens regionale*, a possible region for a science — and both share the underlying concept of *being as the possible object-domain of a science*. Husserl does not interrogate the *being* of consciousness any more than Descartes interrogates the *being* of the *res cogitans*; he posits it as the absolute *region* in advance, governed by the same care for a fundamental, grounding science — so the *in-determination* of the being-character of consciousness (the chapter's title) is the direct heir of the Cartesian disposal of the being-question.

e) The last-motivating connection of Descartes' research and the last-deciding tendencies of Husserl's phenomenology

The fifth moment concerns the *last orientation* of each. In Descartes the horizon is that of the *Catholic faith-system*. This is to be remarked not only in that Descartes lays the *old high-scholastic ontology* at the ground of his fundamental considerations, but shows itself expressly in his *dedicatory letter to the theological faculty of the Sorbonne* prefacing the *Meditations*: his aim is to *provide, in a scientific way, the necessary rational ground for the Catholic faith-system*. This aim springs from an insight into the faith-system that *of itself demands such a grounding*. Heidegger cites the dedication: *although for us faithful it suffices to believe by faith that the human soul does not perish with the body and that God exists, to the infidels no religion, and indeed almost no moral virtue, can be persuaded unless these two are first proven to them by natural reason; and since in this life greater rewards are often set before vices than virtues, few would prefer the right to the useful if they neither feared God nor expected another life; and although it is wholly true that God's existence is to be believed because it is taught in the sacred scriptures, and vice versa the scriptures are to be believed because they*

are had from God — since, faith being a gift of God, he who gives the grace to believe the rest can also give that we believe he exists — nevertheless this cannot be proposed to infidels, because they would judge it a circle. So the being-there of God must be rationally grounded, in order that the one standing outside faith may have motives to submit himself to the rule of faith; and in the sense of this task Descartes undertakes the *Meditation*, with the claim — the sentence breaks at the page boundary — that he believes himself to provide for the first time a fully valid rational foundation. This exposes the *theological-apologetic* horizon of the whole Cartesian enterprise (confirming §27–28, §38). The *Meditations* are not a neutral epistemology but an *apologetics*: the rational proof of God and the soul's immortality, addressed to the *infidels*, in the service of the Catholic faith-system — so the founding text of modern philosophy is, in its declared aim, a piece of theology, and the conversion of *verum* into *certum* serves the securing of faith by reason. The comparison with Husserl's "last-deciding tendencies" (phenomenology as the *fundamental science of reason*, securing the ground of all knowing) will show the structural heir of this apologetic securing — the care for a final, absolute grounding — beneath the difference of horizons.

Heidegger completes the contrast at the level of ultimate orientation. Descartes claims, with the dedication, to have given for the first time fully valid proofs of God's being-there and the immortality of the soul — the *praeambula fidei*, the two basic pieces of faith that reason must establish (Descartes even appeals to a Council); and *one cannot make the intention of the Meditation clearer than Descartes does here*, the secondary question how far he wrote the Sorbonne letter out of *fear of the stake* not affecting it. Against this, Husserl's *more fundamental* consideration, which means to constitute itself in the research of consciousness as the absolute being, is undertaken with the intention *to lay the foundation for an absolute, self-standing reason-science, with the absolute justification of reason, and to exhibit the rules for a perfectly free development of humanity*. This does not exclude that, unexpressed, *remnants of old metaphysics* play along; but Husserl's basic orientation is *fundamentally different*, and from there also the foundation, insofar as it is effective as the *last being-determination of the objects* that come to language. So the horizons differ — Descartes' Catholic apologetics, Husserl's autonomous reason-science of free humanity — and Heidegger grants the difference fully; the commonality he is after lies *beneath* the horizons, in the *care of certainty* and the concept of *being as the object-domain of a fundamental science*, which §47 now isolates.

§ 47. Husserl and Descartes: connection and unified basic tendency in the care of certainty

These differences, springing to the eye on closer consideration, do *not* prevent — indeed they *demand* — that what has been said of the being-determination of the *res cogitans* be *extended* to the positing of *consciousness* as the thematic field of phenomenology. This is all the more demanded, Heidegger says, since *the same care of cognition is at work* in the positing and development of the thematic field of consciousness; only, *the care has here left its origin and stands on a higher stage of movedness — it has obstructed and built over the encounter-possibilities of the specific being of consciousness still more radically*. The thesis of the chapter is thus that the very *superiority* of Husserl (the discovery of intentionality, the sharper evidence) is bound up with a *more radical* burial of the being-question — the care, grown beyond its Cartesian origin, covers its object the more thoroughly the more powerfully it works.

a) Undiscussed taking-over of the cogito sum

Three stations are telling. First, though the *reduction* differs fundamentally in its methodical sense from the doubt-way, it nonetheless *presupposes for itself precisely the result of the doubt-way as a self-evidence*: the proposition *cogito sum*, which springs from the end-situation of the doubt-way, is now claimed *simply as a triviality* at the *start* of the reducing consideration — a triviality *mediated* by the dominant psychology and epistemology (the former under the special influence of English philosophy, which goes directly back to Descartes; the latter insofar as it makes consciousness itself the theme as something *immediately given*). *The cogito sum is in Husserl not only not discussed but taken over as self-evident*; consciousness is the *not-further-interrogated starting-point* at which the whole reduction is oriented. The point is precise: the reduction's *novelty* of method conceals an *un-examined inheritance* of content — the Cartesian *cogito sum* is the unquestioned ground on which the new method stands.

b) Express claiming of the certitudo for the absolute being-region

Second, the *cogito sum* is not only taken over undiscussed as a triviality, but the self-evidence is *extended in a principled sense*: the *certitudo* is now expressly claimed *not only* for a determinate formal-ontological proposition built on the *cogito*, or for the individual *cogitationes*, *but for the totality of this special object-domain as such*. The *cogito* is now posited as the *express norm for grasping this absolute being-region itself*; the self-evidence is at once extended in this principled sense. This is the decisive amplification beyond Descartes. Where Descartes had the *certitudo* of a single proposition (the *fundamentum*), Husserl makes the *cogito*-certainty the *norm of a whole region* — the absolute self-evidence of *consciousness as such* — so the *esse certum* governs not a point but a field, the entire domain of the new fundamental science.

c) Taking-over of the cogito sum as certum for the positing of the absolute self-evidence of consciousness as uprooting

Third, this taking-over is carried out such that *the ground on which alone the sense and right of the certum esse exist is expressly left*. It simply falls into *oblivion* — not first with Husserl but already in the course of the whole post-Cartesian philosophy: *the whole ontological basic-framework is no longer known at all; one expressly wants to know nothing more of it, and the cogito sum becomes free-floating*. While Descartes still tried to *prove* his criterion by reduction to the *absolute being of God*, today one *renounces* this and *demand[s] the absolute self-evidence of this criterion itself*. The development comes to sharpest expression, Heidegger says, in a saying of Husserl (in a seminar exercise): *"If Descartes had stopped at the Second Meditation, he would have come to phenomenology."* That is: *if Descartes had forgotten the whole basic being-connection in which the cogito is justified at all, then what remained would be what phenomenology wants today*. The saying, Heidegger notes, is made *not* from a clear insight into the historical connections but *from the rejection of speaking, right at the beginning of philosophy, about God and the soul*; and therein shows itself *what phenomenology itself wants*: the positing of consciousness in the sense of the *taking-up of the cogito sum as certum* — in the manner of a *self-evidence*, in the form of a *principled extension*, and in the manner of an *uprooting* — so motivated as to *spring from the care of certainty*. This is the heart of the immanent critique. Husserl's "to the things themselves" turns out to rest on the Cartesian *cogito sum*, taken over as self-evident, extended to a whole region, and *uprooted* from the ontological ground (God, the soul, *esse creatum*) that alone once gave the *certum* its sense — so phenomenology *forgets* the very history that would let it understand its own starting-point, and this forgetting is *itself* the work of the care of certainty (which wants no talk of God and soul at the beginning). Husserl's seminar remark is read as the unwitting confession of phenomenology's self-uprooting.

d) Care of certainty as care of science-formation

The care of certainty is here, Heidegger says, a *care of science-formation*: the reforming and new-forming of science in lean on a *held-up science* — the reforming of Cartesian psychology and epistemology into the *fundamental science of the phenomenology of consciousness*. And it becomes evident that for this care the *primary* thing is *to win a subject-domain for possible scientific working*: in advance *all beings are grasped and determined for their possible aptitude as the subject-domain of a science concerning them*. So in the same sense the *encounter-possibility of beings as beings in their being-character is obstructed*, since beings encounter as *the possible region of a science* — whereas one would *first* have to ask *whether the subject-domains that the traditional scientific disciplines offer have a genuine origin from the being-world they allegedly want to concern*. The *thematization* is to be *undone*; one is to ask after the *specific being as such*, and whether it is in need of *formation* for a science concerning it — only so can one speak of a possible *constituting of new sciences*. And since today, Heidegger says, the distinguished situation obtains that *through the dominance of the*

care of science-formation all life-domains and being-worlds are peculiarly theoretized, the basic task arises: first to go back behind this theoretizing, in order to win anew, from Dasein itself, the possible basic position. This is the constructive program announced at the threshold of the final chapter. The *theoretizing* of all life — the conversion of every domain into the subject-matter of a science — is the universal effect of the care of science-formation, and the task of fundamental ontology is to go *behind* it, to *Dasein* itself, to win the ground that all the inherited sciences (which may have no genuine origin in the being they claim) presuppose and cover.

Chapter Three: Husserl's more original omission of the question of being relative to the thematic field of phenomenology, and the task of seeing and explicating Dasein in its being

§ 48. Husserl's deformation of the phenomenological finds through the care of certainty derived from Descartes

The tendency alive in Husserl, Heidegger says, brings *further fateful determinations* with it — and fateful *precisely for what was exhibited in phenomenological research by Husserl*, because it gets *deformed* (*verunstaltet*) in that the *interpretation of the results* is carried out *in the sense of the care of certainty and of what it takes care of*. These deformations are to be considered in three respects: with regard to *intentionality* itself; with regard to the *grasp of evidence*; and with regard to the *determination of phenomenological research as eidetic*. The three together show that *the cogito sum and its certitudo are, in a much more fundamental sense, nevertheless alive in Husserl* — so that here even less does it come to an express inquiry after the being-character of consciousness; rather *all interest is here transferred to forming a basic science and to considering beings in advance with a view to their aptitude as the theme of this basic science*. Being in the sense of *region-being for a science* obstructs still much more the possibility of *letting beings encounter in their being-character*. This is the structural irony the chapter unfolds: Husserl's *positive* discoveries (intentionality, evidence, eidetic analysis) are the very things the care of certainty *deforms*, so that the more phenomenology achieves, the more thoroughly it covers the being-question.

This tendency, grounded in the dominance of today's science-idea, must be *laid on the reversed side*, since it is necessary to see that *this positing is not an original one*. The concept of consciousness is in fact *simply taken over by Husserl from Cartesian psychology and Kantian epistemology*, and with it *the totality of the fundamental categories* in which consciousness is characterized — categories that for their part *do not owe their origin to an analysis of this being in the sense of an inquiry after its specific being-characters*. So, if the task of making consciousness the theme rightly exists, one must *first* ask: *which is the specific being that is here made into a*

subject-domain? And from here too the way leads back to the *necessity of determining the content of a region by regress to its pre-regional character*. This tendency springs from the dominance of the care of certainty in the specific enactment-mode of the care of science-formation. The demand is the program of fundamental ontology: before consciousness can be the theme of a science, its *being* (its "pre-regional character") must be interrogated — which Husserl, taking the concept ready-made from Descartes and Kant, never does.

a) Intentionality as specific theoretical self-comporting

The same care of certainty now deforms, in a peculiar way, what was positively achieved in phenomenology — first, *intentionality*, insofar as it is grasped (less expressly than *unexpressly*) *always as a specific theoretical self-comporting*. It is characteristic, Heidegger notes, that intentionality is mostly rendered in translation by *Meinen*, meaning, so that one speaks of *willing, loving, hating meaning*; and by this fixing a determinate *prefiguring of the line of sight* for every intentional analysis *creeps in* — shown expressly in the conscious claim that *for every intentional connection of a complex kind the theoretical meaning forms the foundation, that every judgment, every willing, every loving is founded on a representing* that gives the willable, the hateable and loveable, in advance. This reformation lies in the fact that *the predominant study of intentionality is oriented at the intentional in knowing itself*, and it is a *methodical misunderstanding to simply analogize the investigation of the emotional experiences with knowing* — characteristic precisely because therein lies the *taking-over of structures won in a wholly different consideration-direction*. And *beings too*, insofar as they are in principle to be studied in their *immediate givenness*, are taken in the *specific theoretical apprehension: beings are exemplified at the real being qua thing*, and this being *qua nature-thing*, as the foundation of all the various being-possibilities, becomes the underlay for the determination of culture, history, and so on — such that one *sets upon being-as-nature the character of a value*. So even within the construction of the being-regions themselves, the predominance of the care of certainty shows itself in the *attitude toward the theoretical knowing of nature*. This is the first and deepest deformation, and it ties the whole lecture together. Intentionality, the discovery that *opened* ontology (§46b), is *narrowed* back to the *theoretical*: meaning-as-representing is made the foundation of *all* intentional life (willing, loving, hating), so the primacy of the theoretical (the λόγος ἀποφαντικός of §2, the gaze of §11) is smuggled back in — and the nature-thing is made the paradigm of *being*, with culture and history (and value) built on top, exactly the naturalism the critique of §8 had exposed, now found at the root of phenomenology's own construction.

b) Evidence as grasping- and determining-evidence of theoretical knowing

Second, in the *interpretation of evidence*. Evidence plays a fundamental role within phenomenology's method, not least on the ground of the connection with Descartes' *cogito*; and Heidegger again credits Husserl generously: *what Husserl says about evidence is far superior to everything else ever said about it, and he has for the first time placed the matter on a suitable ground*. Ultimately evidence is interpreted, in its enactment-mode, as the *covering (Deckung)* of the *meant* and the *at-itself-grasped*: this *bringing-to-covering* of a meant with an intuitively pre-given constitutes evidence, and the evidence is itself *normed by un-disputedness and conflict*, analogously as the *cogito sum* is normed by the principle of contradiction. But this evidence, Heidegger objects, is a *specific grasping- and determining-evidence*, which is then *analogously transferred* to the other comportments and their evidence — so that Husserl sees that *each object-domain, according to its content, has a specific evidence, whereas the proper evidence-question, in the fundamental sense, first begins with the question after the specific evidence of the access to a being and of the disclosing of this being, the retaining and self-holding to a being become accessible*. Only within this so-grasped phenomenon has *theoretical evidence* its place; and *evidence in Husserl is determined by his concept of truth*. This is the second deformation and the precise point at which Heidegger's own concept of truth diverges. Husserl's evidence is the *covering of meaning and intuition* — a *theoretical fulfillment*, normed like the principle of contradiction — and is then universalized over all comportments; but the *founding evidence* is the *disclosedness of the access to a being*, the *Erschlossenheit* and the *holding-to* a being become accessible (the *Entdecktheit* of §34, the ἀληθείειν of §2), within which theoretical evidence is only a *derivative* mode. Husserl's truth-concept (truth as fulfillment, §22) governs his evidence and so keeps it theoretical; Heidegger's (truth as uncovering) would ground it in being-in-the-world.

c) Eidetic reduction of pure consciousness under the guidance of consciousness-foreign ontological determinations

Third, the predominance of the care of certainty shows itself in that, with respect to the thematic field "consciousness," *one remains with the determinations of traditional ontology — indeed, still further, with those of formal logic*. The domain of *pure consciousness*, won through the *transcendental reduction*, is at first, as pure consciousness, *simply the once-ness of a determinate individual being of the consciousness-stream*; but so it is *not yet properly a possible domain of a science*, for it matters to win *scientific propositions*, not to speak of *this or that* pure consciousness — *pure consciousness in general* is to be determined. So the transcendental consciousness falls to a *further reduction*, the *eidetic*: the *genus-characters* of the various experiences are to be exhibited — consciousness in general (determined by the basic character "intentionality") and then the various basic genera. And the methodical partition, Heidegger stresses, is *led by ontological determinations: genus, species,*

eidetic singularity, specific difference — categories that have their determinate ground and say nothing about a being like consciousness. With this predominance of the care of certainty it is *no wonder* that within the forming of the method of researching pure consciousness *something like the idea of a Mathesis of the experiences became possible* — a fact that shows *how strong the Cartesian science-tendency is alive.* Husserl leaves, in the *Ideen*, the question whether the descriptions of pure consciousness are possible *through a mathesis of the experiences* still in suspense; but *today it has become factual*, and the whole intensity of Husserl's work concentrates on *finding a still much more radical starting-point in the cogito than Descartes managed*, in order from there to find the *mathesis of the experiences*, to determine *purely a priori the pure possibilities of the experiences.* This is the third deformation and the convergence with §36's *mathesis universalis*. The eidetic reduction analyzes consciousness with the *logical* categories (genus, species, difference) that are foreign to it, and drives toward a *mathesis of the experiences* — the dream of an *a priori*, mathematical science of consciousness — so that the *Cartesian* projection of the *mathesis universalis* (§36) reaches its term in Husserl's late work, and the being of consciousness is dissolved into a calculus of pure possibilities, the furthest covering of the φαινόμενον.

Heidegger then states the verdict. The phenomenological principle "*to the things themselves*" has undergone a determinate *interpretation*: "*to them insofar as they come into question as the theme of a science.*" So Husserl obstructs to himself what he wants, insofar as the consideration is *restricted to the field of the regional characters of beings*; and *through the positing of consciousness as the thematic field of phenomenological research*, what every philosophy is out for is obstructed in the proper sense. *Consciousness is the region of experiences; life itself, as the totality of experiences, is determined as the subject-region of these individual facts* — and it does not come to understanding life itself in its proper being and to answering the question after its being-character. And the famous indictment: *all humanity-, all spirit-, life-, culture-philosophy is a single lucus a non lucendo* — a "grove" so called *because it does not shine*, a name that contradicts the thing — for *one wants to make a philosophy about Dasein without having interrogated it itself.* This is the culminating charge of the whole lecture, and the precise sense of the Third Part's title. Husserl's own maxim ("to the things themselves") has been inverted into "to them as themes of a science," so that phenomenology *bars itself* from the very thing all philosophy seeks; *consciousness and life* are made the *region* of facts to be classified, but their *being* is never asked; and so the whole contemporary edifice of *Lebensphilosophie*, *Geisteswissenschaft*, and philosophy of culture is a *lucus a non lucendo* — a discourse "about" *Dasein* that has never once interrogated *Dasein* in its being. The way is thereby cleared for the only remaining task: to interrogate *Dasein* itself.

§ 49. Research into the origin-history of the categories as presupposition for a seeing and determining of Dasein

One could object, Heidegger acknowledges, that the *apparatus* for winning this insight was very *circumstantial* and that the *result* is very *meager*. To this he answers that the insight into the established *omission* would be a *misunderstanding if one wanted to understand it as a result*: merely to win a *view of Husserl's standpoint* would be *the most indifferent thing in the world*; it comes down to the *underlying states of affairs*. One fact must be held fast: that the *workings* of what today, in the decisive sense, is posited as the theme of philosophy stand *under the effect of a determinate tendency*, and that *even within phenomenology it does not suffice to appeal to a mere beholding and self-giving to the matters* — for it could be that *all that is laden with an immense sum of prejudices*. To come to the things themselves, *they must be freed*, and the *freeing is not that of a momentary upswing but of fundamental research*; the *seeing must be formed*, and this task is *so difficult that it can hardly be over-estimated*, because we, *like no other time, are shot through with history and have a consciousness of the manifoldness of history*. This is the methodological self-defense of the whole lecture and a corrective against a sentimental phenomenology. The "result" is not a thesis about Husserl but the *opening of a task*; "intuition" is not enough, because the gaze is laden with inherited prejudices; and the *freeing* of the matters demands the laborious *forming of the seeing* through the *Destruktion* — the more urgent precisely because *our age is saturated with history*.

And the apparatus for reaching the insight of the omission is *far from exhausted*, since *we have followed only one strand: knowing and the care of knowing, and their correlate, truth* — connections that are today *still the most easily accessible*. *Much more difficult* is the connection between the *non-theoretical being of the human* and what one calls the *bonum*; not that one could simply *analogize* the consideration — here *wholly other connections* come into question, *Christian theology and the formation of dogma*. And it shows itself that, *just as the ἀληθές fell to the verum and certum, the ἀγαθόν undergoes into the present a characteristic decline-process, until it is determined as value*. Heidegger announces that he will exhibit the most important of these connections in the *Augustine-lecture*, in the analysis of the Augustinian concepts *summum bonum, fides, timor castus, gaudium, peccatum, delectatio* — for *in Augustine the various possibilities center, such that from him the effect-forces go out upon the Middle Ages and modernity*. This widens the *Destruktion* beyond truth to the good. The history traced for *truth* (ἀληθές → *verum* → *certum*) has a *parallel* for the good (ἀγαθόν → ... → *value*), and the second decline runs through *Christian* (Augustinian) channels rather than the Greek-scientific ones — so the full *Destruktion* would require the regress through Augustine that Heidegger reserves for another course. The reduction of the good to

value (Scheler, the neo-Kantians) is named as the counterpart of the reduction of truth to validity.

But even this decline-history is not sufficient to win the own situation of seeing the connections in question. Both basic determinations (the verum and the bonum) must be taken back to Greek ontology, and this itself must be considered insofar as it forms a determinate psychology, a doctrine of life — or however one designates it. Only a research, so fundamentally oriented, of the specific origin-history of the categories will put one in the position — free of the categorial determinations that have grown in a wholly other field — to see Dasein as such, out of concrete experiences, and to determine it categorially. This is the full statement of the Destruktion as the presupposition of the analytic of Dasein, and the program that Sein und Zeit will announce as its "destruction of the history of ontology." One cannot see Dasein directly, because the categories one brings (consciousness, subject, value, validity) have grown in other fields (created nature, the theoretical, the theological); only by tracing the origin-history of these categories — verum and bonum back to Greek ontology, and Greek ontology back to its own "doctrine of life" — can one win the freedom to see Dasein from concrete experiences and to coin its own categories (the existentials).

Heidegger closes the section with a sober statement of what has and has not been achieved. *What we have won here is a little, and it would be a misunderstanding to take the won in the sense of a philosophy: it does not matter to win a philosophy, and whoever wants that is advised to seriously avoid the ways of this research. The research that sets itself this task stands outside what one designates as philosophy in the current sense; it sets itself only the task of forming the ground for such a thing, and in this task it stands in the constant danger of silting-up and of failing. Yet, if the worked-out is negative in a quite determinate sense, it must also be said that nevertheless something Positive was won on the way of the demonstration of the omission: we led the demonstration of the omission on the way of the exhibition of the specific characters of the care, and determined the care as a way of Dasein — and this positive result too comes at first only as a contribution to the clarification of the specific situation of the interpretation; the more transparent the situation becomes from which the interpretation enacts itself, the more grows the possibility of placing and seeing the historical.* This restates the Vorbemerkung ("it is over with philosophy"; "of significance are solely the states of affairs") and the doctrine of the hermeneutic situation (§17). The course does not deliver a "philosophy" but *prepares the ground*; its risk is real (silting-up, failure); and its *positive* yield is the determination of the *care as a way of Dasein* — won not as a doctrine but as a clarification of the *hermeneutic situation* itself, whose increasing transparency is the condition for genuine historical seeing. The negative demonstration of the *omission* is, in truth, the positive opening of *Dasein* as the matter of the analytic to come.

§ 50. Repetition of the run-through characters of the care of cognition and exhibition of Dasein itself according to some fundamental determinations

Heidegger now gathers the whole. We will try, he says, *to gather what we have won on the way of the consideration with regard to the being of the care*, and to make present *what announces itself, in the various characters of the care as a way of the being of Dasein, with regard to the being-character of Dasein* — what at these characters of the care, in particular the care of cognition, is seen of the being-character of *Dasein*. And in this gathering and further interpretation of the care as a *Wie of Dasein*, we will strike a *fundamental connection between the being of the care itself and the cared-for of this care* — what properly stands in the care, *Dasein as such*; with this we win a *more original grasp* of the connection that met us already at Descartes in a *over-hasty and formal interpretation*: namely *that consciousness is a being that is in the way of the having-itself-along (Sich-mit-haben)*. This state of affairs Husserl takes as the ground for the forming of the way, the method, of phenomenological research itself; we see *in it a peculiar being-determinateness of the care, and thereby — insofar as the care is a Wie of Dasein — Dasein itself*. This is the methodological turn of the whole final section. The phenomenon Descartes glimpsed and perverted (the self's *having-itself-along*), and which Husserl made the ground of reflective method, is now to be read *positively* as a determination of *Dasein* — the self-disclosure that belongs to the being of the one who cares.

Heidegger restates the verdict on the phenomenological maxim. At the call of phenomenology "to the things themselves," "*Sache*" means *the being insofar as it encounters in the character of a possible region for a science*; every being is seen *through science* (the aesthetic, for example, through art-history), so as it is able to be objective. The principle thus has *seemingly* a radical tendency; but *as it is interpreted, it obstructs the way and does not free it*. The *freeing of Dasein is not self-evident* and is not given without further ado by switching off easily surveyable prejudices; accordingly the task arises *to explicate Dasein in its being — but first to form and secure, for this very task, the standpoint: a task not of method but of concrete research*. In this introductory consideration the gaze was from the outset directed at *one determinate Dasein-phenomenon, knowing*, determined as the *care of cognition*; and the characterization of the various *truth-concepts* (from being in the mode of *being-uncovered* to being-true in the sense of *value*) is *one strand* at the basic phenomenon held in view from the start and designated as *Dasein*. A *far more important* research-stretch concerns the *ἀγαθόν*, the good; and both inquiries, oriented at the *ἀγαθόν* and the *ἀληθές*, are to be taken back into a *more original being-connection* — that of what Greek ontology treats. Insofar as all inquiries are taken back to it, ultimately to *the being of the human*, one can also call this process *anthropology* — but then not in the sense of the historically presenting analysis of

Dilthey, but of an inquiry that is in principle set on categorial connections. So Heidegger names his enterprise, with a caveat: it is an "anthropology" only in the sense of a *categorial* (ontological) analysis of the human's being, not the descriptive science Dilthey practiced — the analytic of *Dasein*, whose categories are the *existentials*.

In repeating the run-through, Heidegger says, we direct the gaze more expressly at the *care of cognition as a way of Dasein* and thereby at *Dasein itself*, attending to how far the characters explicated with respect to the caring are determined as *being-characters of Dasein* — so that *we take the demonstration of the omission as the exhibition of Dasein itself according to its fundamental determinations*. What steps forth in this demonstration is *not* to be sought as *result and theory*; the proper and only way of reflecting on what is won is *to make it fruitful for the forming of the ground in which the concrete research is to be carried out, to sharpen the gaze for what stands in the fore-look: to interrogate Dasein with regard to its being-categories*. The more originally the *situation* forms itself and becomes transparent for itself, the more does what is to be subjected to interpretation become *sightable and graspable*. In this methodical significance alone is what we exhibit to be taken. And Heidegger fixes the two key determinations: *we have determined the care, formal-indicatingly (formal anzeigend), as a Wie of Dasein*, and the care is taken in a determinate concretion as the *care of cognition*; these two — *care as a Wie of Dasein, in the care of cognition* — are now to be made concretely present. The whole final exhibition is thus declared a *formal indication*: not a theory of *Dasein* but a sharpening of the gaze that prepares the analytic to come.

a) Three groups of characters of the care for known knowledge and their unified determination

Heidegger restricts himself to *one* character of the being of the care won at the exhibition of the fundamental care-character: *the being of the care of certainty as disclosing-being (Erschließendsein)*; only with regard to this will he interpret the exhibited care-characters as characters of *Dasein*. He recalls the five moments: *disclosing-being* as the primary movedness of the care of certainty; the *retaining* of the disclosed; the *developing* of the retained; the *devoting-oneself* to the developed; and the *losing-oneself* in what the care has devoted itself to. We saw earlier how the care of certainty lets itself be characterized as *omission* and *entanglement*, holding itself in the peculiar movedness in which *Dasein goes out of its own way*; at that stage the interpretation was left standing, and we did not go on to *see the characters of omission and entanglement upon Dasein*. Now it comes to abstracting the care of certainty, in the concretion of its movement as disclosing-being, into its specific care-characters and *understanding these as being-characters of Dasein* — an interpretation that has the defect of being one-sidedly presented, without the concrete connections that the interpretation of the ἀγαθόν would bring into view.

He enumerates the care-characters in *three groups*. The *first group*: the *self-heightening* (*Sichaufsteigern*) of the care of certainty in the rule-taking, the self-heightening as a *self-overreaching* (*sichvergreifend*); in one with these, the *Beruhigung* (tranquilizing) — insofar as the *certum esse*, as a being-possibility, is relocated into the *esse creatum* as a *bonum* and thereby *secured by being-created*; and a fourth, *Maskierung* (masking). The *second group*: the characters of *Verstellen* (obstructing), of the *temporalizing of the needlessness* of the inquiry after the being-character, and of *Verfallen* (falling). The *third group*: the characters of *Verbauen* (building-over) and *Verlegen* (mis-laying, relocating). *Each of these three groups leads back to a specific character of the being of the care of certainty.*

α) Self-heightening, self-overreaching, tranquilizing, and masking as remoteness-from-being

In the first group, the *self-heightening*, the care of certainty shows itself such that it relocates itself into a quite determinate dwelling that Heidegger determines as *Seinsferne*, remoteness-from-being. For it matters to the care of certainty *primarily about validity and bindingness; that of which something is valid — the being itself — does not come primarily into view, does not come to its right*. At the same time *the being of knowing is not, in itself, interrogated as to its being, and is not shaken in its being — though it looks as if that were the case, and looks so precisely through the seeking*. But this *eversio*, this *seeming shaking of all cognition-possibilities*, enacts itself *on the ground of the pre-tranquilizing that the certum esse, as bonum, is secured*; the *eversio* and the running-through of a doubt-way is the peculiar *masking* the care of certainty gives itself, *as if it in fact mattered to it to reach a radical foundation*. Through this masking the care transposes itself where it wants; it gives itself the *look of radical scientificity*, of taking-care of science-formation, science understood as the *universal validity and bindingness of all beings*. So the care of certainty dwells in the manner of *masking*, in the bindingness of *what can be publicly and timely said of beings*, without the being as such being primarily made present; *everything is seen at the idea of science*, the reformation of science at the idea of the *certum*. This dwelling Heidegger characterizes as the care's *remoteness-from-being — both from the being of the world and, all the more, from the being of Dasein as such*. This is the first existential character won from the care: the *Seinsferne*, the constitutive *distance from being* of a knowing fixed on validity, whose very radicality (the doubt) is a *mask* covering a prior tranquilizing. The whole apparatus of Part Two is here read as a *way of Dasein's being — its remoteness from its own being*.

β) Obstructing, temporalizing of needlessness, and falling as the staying-away of the temporality of Dasein

The *obstructing* and the *temporalizing of the needlessness* (which encloses the moment of *omission*) characterize a new moment of the being of the care. Through the care's dwelling at validity and at the taking-care of binding propositions, and through the

science thus coming to regard, *the access to being is definitively obstructed*, insofar as it is taken *through science*. So it comes about that the care, dwelling thus, becomes *needless* in the sense that it *does not interrogate at all what it works with* — the whole *fundamentum* of the old ontology — as to its *aptitude and origin*; *the tradition is not itself seen as tradition*. When *what is befallen by a tradition, and how, stands in view*, then the tradition is *express*; insofar as that is *not* the case — when the traditional is so taken over that the whole founding-work is taken over — the tradition does *not* stand in view. And since the tradition comes *from the past*, and the *sightedness of the past* is lacking to the present and does not become alive, it happens that *in the various characters the temporality of Dasein stays away (bleibt aus)*. This shows itself, Heidegger says, in that *Descartes grasps the cogito merely as a res cogitans, as a manifold of cogitationes, in which there is not the least talk of a temporal extension between birth and death — a manifold of things tied together by the ego*. The care of certainty, as care for certainty, is *at once the caring that temporality stays away* — which says: *the non-encountering of Dasein as such; the care of certainty is the obstructing of being*. This is among the most important results of the lecture and the direct preparation of *Sein und Zeit*. The care of certainty *blocks the temporality of Dasein*: by taking over the inherited ontology without seeing it as tradition (without the "sightedness of the past"), it loses the *historicity* and *temporality* of the self — shown exactly in that the Cartesian *res cogitans* is a timeless manifold of *cogitationes*, with no *being-toward-death*, no *stretching-between birth and death* (the *Geschehen* of *Sein und Zeit* §72). To obstruct the being of *Dasein* is to obstruct its *temporality*; the being-question and the time-question are one.

γ) Building-over and mis-laying as the leveling of being

The last group, *building-over* and *mis-laying*, gives, beside the remoteness-from-being and the staying-away of temporality, a *third* determination of the being of the care of certainty: the *leveling of being (Einebnung des Seins)*. Insofar as the care of certainty, as care of validity and proposition-bindingness, takes its dwelling at the *formation of science*, the being is grasped as a *determinate All of possible regions, affectable by a manifold of sciences; all being is posited in advance as a manifold of being-regions affectable by valid propositions*. And therein lies that *Dasein as such is transposed into the same unified being-field as the being* — so that the care of certainty *builds over*, in an express sense (in the context of the care of science), *the possibility that the being of Dasein, in its own possibility, could encounter being-wise before this primary ordering*. The care of certainty *relocates every question of being to the question of being-an-object for a science*, and *within this basic question-direction every being-question is decided*; with respect to *Dasein* this means *the care of certainty itself beats all being onto one and the same level*. This is the third existential character: the *leveling of being*, in which *Dasein* is forced into the same homogeneous field as natural things and so can never appear *in its own kind of being*. The reduction of every

being-question to "object-for-a-science" (the Husserlian being-concept of §46d) is the leveling that *Sein und Zeit* will combat with the categorial difference of *existentials* and *categories* — the refusal to let *Dasein* be one region among others.

b) Flight of Dasein before itself and the uncoveredness of its being-in-a-world, the burying of its encounter-possibility, distortion as the basic movedness of Dasein

These three characters — *remoteness-from-being*, *the staying-away of temporality*, and *leveling* — are to be seen *in one* as the basic determination of *Dasein itself*, and it is to be asked *how Dasein as such shows itself in this*. First, these three characters of the care of certainty (certainty itself a way of *Dasein*) *announce Dasein as on the flight before itself*, such that, *fleeing before itself*, it *co-cares the possibility of covering Dasein*. Second, the *flight before Dasein itself and the burying (Verschüttung) of its encounter-possibilities for it*. In this basic movedness shows itself the *basic find* discussed earlier: the care, out for something it cares for, *co-cares its own Dasein in caring for something* — here, in the way of *flight before Dasein*, it *co-cares the burying of Dasein itself, the impossibilities of its encountering*. To *co-care the being of the care in the caring being-out-for-something* is the *same phenomenon* that Descartes took as the occasion (the *cogito me cogitare*) for a formal-ontological proposition, and that Husserl developed as *reflection*, the special way of access to consciousness. For us, Heidegger says, *it shows a peculiar basic movedness of Dasein itself*, and this movedness holds *for every concrete care*. This basic character — *one of the orientation-points for a fundamental interpretation of Dasein* — Heidegger designates terminologically as *Verdrehung*, distortion. With it is meant that *in advance Dasein primarily cannot be grasped through the phenomenon of intentionality: intentionality has in advance the direction onto seeing something in the direction onto something*. This is a decisive and surprising turn against Husserl, and the deepest stratum of the critique. The very *self-having* that Descartes formalized and Husserl made the ground of *reflection* is, read positively, the *basic movedness of Dasein* — but it is *not* intentional: it is *Verdrehung*, the turning-back of *Dasein* upon itself *in its caring-for-the-world*, the co-caring of its own being. And because intentionality is structured as *directedness-at-an-object*, *Dasein cannot be primarily grasped through it* — intentionality has *limits*. The phenomenologist's master-concept is shown to be *insufficient* for the being of the one who has it.

Heidegger clarifies what it means that the being-structure of *Dasein* lies in the structure of *Verdrehung*, from the sharper grasp of the being-on-the-flight before itself. Since here it is a matter of the care of certainty, which is out for the *grasping of the world*, every grasping being-out-for-something, every *determining of the what-being of the world*, is always in some sense a *co-determining of the being of knowing as such*, expressly or not. *Every grasping-being, every knowing, seen on the basic phenomenon of*

Verdrehung, is interpretation of *Dasein* itself. But this says: the being of *Dasein*, in the mode of the care of certainty, is *on the flight before itself in the way of a being-known, of its interpretedness*; what the care flees is *Dasein in the possibility of its being-known and its interpretedness*. And then the decisive determination: *being in the sense of being-in-a-world means being-uncovered (Entdecktsein), standing sightedly in a world; the uncoveredness of Dasein is that before which the care is on the flight*. An attempt that did not come to ripeness, Heidegger adds, is the *ἀληθές* of Greek ontology: *this ἀληθές is a glimpse of the Greeks into uncoveredness, but was again covered over by the Greeks themselves*. We want to make present what it means that *Dasein flees before itself with regard to its basic determination of being-uncovered, of sightedly being-in-a-world*; and the phenomenon of *Entdecktheit* will give occasion to grasp still more sharply *how historicity is a basic determination of Dasein itself*. This is the conceptual summit toward which the entire course has been building. The being of *Dasein* is *Entdecktheit* — *uncoveredness, disclosedness* — the *standing-sightedly-in-a-world* that is *In-der-Welt-sein*; and the *ἀληθές* of the Greeks (truth as un-concealment, the *φαίνόμενον* of §1–§2) was a *glimpse* of exactly this, covered over again by the Greeks and lost in the descent to *verum* and *certum* (§21). The whole history of truth traced in the lecture is the history of the *covering* of *Entdecktheit*; and the positive task — the analytic of *Dasein* — is the *recovery* of *Entdecktheit* (the *Erschlossenheit* of *Sein und Zeit* §44, where truth is grounded in the disclosedness of *Dasein*). The care of certainty *flees* this uncoveredness; phenomenology is the courage to face it.

Heidegger recapitulates the three groups once more — the *Seinsferne* (the care beruhigt at certainty, never reaching the being of itself), the *staying-away of temporality* (the un-appropriated tradition, the un-transparency of the being of knowing about its own being-possibilities, since "only where a being sees itself in its situation can the tradition that befalls it become express"), and the *leveling of being* (all beings on one ground-level, dictated by the systematics of science) — and gathers them: insofar as knowing is, in these respects, *removed from beings and especially from the being of Dasein, that is, from itself*, this movedness characterizes *the movement of the flight of Dasein before itself*. This flight is not simply a moving-away from *Dasein* into the dwelling of science; *in one with this flight before itself, Dasein cares the relocation of itself*: through this ontology it is made *impossible that Dasein qua Dasein can encounter itself*; from the caring of the idea of science a determinate ontology is formed and held fast as *the only possibility of the interrogability of Dasein* — the tendency of the *burying of Dasein itself*. So the *Destruktion* of the inherited ontology (Part Two) is justified once more: the inherited ontology is *Dasein's own flight from itself* solidified into a doctrine, the burial of the being it cannot face.

Heidegger sharpens *Verdrehung* itself. The being in the sense of *Dasein* is *not* characterized by "something relates to something," by "I relate to an object"; rather, this phenomenon says that *the being one wants to hit with "consciousness" is one that, in being-placed-toward-the-world, co-cares its own Dasein. No express reflection on the I need appear; in the matter one pursues lies a caring of Dasein itself, and where reflection is lacking, the phenomenon shows in its ownmost sense* — for just then it is visible that this *Verdrehung* is an involvement of the proper being of the care in the cared-for, visible in that *it permeates Dasein in its being: in the sense of this being, it is itself*. Here, Heidegger says, we fight a special linguistic difficulty, because *Dasein* is a being that, to be adequately ontologically determined, cannot be determined as a being one has, but as the being one is. Therein lies already a quite determinate interpretation of the being as the *being-there*; and this character shows a *being-possibility* of *Dasein*: *the being one is is the being that carries in itself the possibility of becoming "I am" — but this possibility need not lie expressly in Dasein; indeed Dasein is out to relocate this possibility*. This is the formulation that *Sein und Zeit* §9 will make famous: *Dasein* is the being whose being is *to be* (*Zu-sein*), the being *one* is not *one has* — the being for which, in its very being, its being is at issue. And the *self-having* (the becoming-"I am," the *Jemeinigkeit*) is a *possibility*, not a standing fact, one that *Dasein* may *flee* — the possibility of *authentic* selfhood that everyday *Dasein* relocates and covers. The self is not given as a *res* (against Descartes) but is a possibility to be seized (against the formal ego).

And finally the methodical fruit. This basic phenomenon *Verdrehung* — long determined as *reflection* — is here *concretely seen*, in the fore-look on the being-structure of *Dasein*; for us it has the character of a *methodical guiding thread*, insofar as *from this phenomenon the basic character of consciousness, intentionality, is cut back to its limits, to the limits of its interpretation-function*. And at once this phenomenon is *the structural ground on which such phenomena as joy, terror, mourning, anxiety (Freude, Schrecken, Trauer, Angst) become explicable — phenomena that are overlooked when they are determined as intentionality. The phenomenon of anxiety I cannot grasp as a being-related-to-something; it is a phenomenon of Dasein itself*. This is the direct anticipation of *Sein und Zeit* §40. *Angst* is *not* intentional — it has *no object* (it is anxiety *in the face of* nothing determinate) — and so it cannot be a "consciousness-of-something"; it is a phenomenon of *Dasein itself*, a *Grundbefindlichkeit* in which *Dasein* is disclosed to itself in its bare *that-it-is*. The affective disclosure won from Aristotle's ἡδονή/λύπη in §2f, deepened through *Befindlichkeit*, here reaches its term: the moods (and above all anxiety) are the structural ground that intentionality cannot reach, and the limit of phenomenology's master-concept is the threshold of the existential analytic.

c) Facticity, threat, uncanniness, everydayness

It is important, with respect to the concrete ground, that one keep in view the ground for the further forming and characterization of the movedness of the care of certainty as the *fleeing of Dasein before itself in the way of covering*. *The care of certainty flees before Dasein insofar as it can be known; the flight of knowing before Dasein itself is the flight of cognition before Dasein in the character of its possible transparency, interpretedness, uncoveredness. Dasein is in the character of being-uncovered; it is being-in-a-world*. This phenomenon has the being-character of the being that is *in the how of being-in-a-world as being in the Da*; of a stone we also say "it is there," but it is there *in the circle of my world, of my being, which is in the world in the way of having-the-world-sightedly (die Welt sichtig-habens)*. *Having-sightedly means being-co-sighted of the being that is in the world, and this co-sightedness is expressed in the Da: Dasein is here and now, in the Jeweiligkeit, is factual; facticity is not a concretion of the universal but the proto-determination (Urbestimmung) of its specific being as Dasein*. This is the determination of the *Da* of *Dasein* and of *Faktizität*. The stone is "there" only *within* a world (a worldless being, present-at-hand); *Dasein* is its *Da* — it is the open "there" in which the world is co-sighted, disclosed — and this *Da* is each-time-mine, *here and now, factual*. *Facticity* is not the instantiation of a universal "human nature" (Descartes' *res cogitans* as a manifold of *cogitationes*) but the *Urbestimmung*, the primordial determination, of *Dasein's* being: that it *is*, in each case, this thrown, situated *there* (the *Geworfenheit* of *Sein und Zeit*).

Looking closer at the flight of *Dasein* before itself in the way of covering — at *how, in this flight of being before itself, the sense of Dasein interprets itself* — it shows that *Dasein is such that it defends itself against itself (sich seiner selbst erwehrt)*; and *this defending-against-itself is not a contingency of Dasein but makes up its being*. *What it defends against — the threat (Bedrohung) — lies in Dasein itself; the threat against which Dasein defends itself lies in that it is: that it is is the threat of Dasein itself*. This phenomenon of *threat*, with regard to the *defending-itself in the way of flight and covering*, we see in the special restriction of the care of certainty. This is the penultimate determination and the immediate ground of anxiety. *Dasein* is the being that *defends itself against its own being*, and this is *not* an accident but *constitutive*: the *threat* is not an external danger but *the bare fact that Dasein is* — its naked *that-it-is*, its thrown being-in-the-world, exposed and uncovered. *Dasein* flees its own *Da*. The "threat that it is" is what *Sein und Zeit* will call that *in the face of which* anxiety is anxious: *being-in-the-world* itself.

Asking *against what Dasein defends itself* and *what the threat is before which it flees*, Heidegger takes the index of the consideration from the *Wohin*, the whither, of the flight and the being of the fleeing. The care of certainty characterizes the being of *Dasein* as one *to which it matters to go up in a tranquilizing (Beruhigung)*; in this tendency of the care of certainty lies the *care of the tranquilizing of the being of knowing itself*. For the

concrete visualization Heidegger draws in the *second* possibility, the *care of curiosity* (*Neugier*), the one that *especially led Greek knowing*: to knowing it matters *to become at home in beings, to be at home in them in the way of secured being-there*. And since *familiarity in the world is the whither of the flight*, this says nothing other than: *what Dasein flees, in the way of the care of certainty, is the Unheimlichkeit* — the uncanniness, the un-homeliness. *Unheimlichkeit is the proper threat under which Dasein stands; Unheimlichkeit is the threat that lies in Dasein itself; and Unheimlichkeit shows itself in the everydayness (Alltäglichkeit) of Dasein*. This is the final word of the lecture, and the full anticipation of *Sein und Zeit* §40. The whither of the flight is *familiarity*, being-at-home, the *secured dwelling in beings* (the *Beruhigung*, the *heimisch*-being of curiosity and certainty); therefore that *from which* it flees is *Unheimlichkeit* — the *not-being-at-home*, the uncanniness that is *Dasein's own threat*, its naked exposure to its *that-it-is*. And — the decisive structural insight — *Unheimlichkeit shows itself precisely in everydayness*: it is not a rare mood but the constant ground of the average, tranquilized, familiar self, which is *everydayness as flight from uncanniness*. The whole diagnosis of the care for known knowledge (Descartes, Husserl, the modern theoretizing of all life) is gathered here: it is *Dasein's everyday flight from its own uncanniness into the familiar and the secure*.

Heidegger's last sentences guard the phenomenon. This phenomenon of *Unheimlichkeit* has nothing to do with loneliness, with a *not-being-able-to-be-present that withholds this or that from one*; it does not become visible insofar as *Dasein loses itself in reflection on itself*, and it is obstructed when one grasps *Dasein in the sense of a personality*. *Uncanniness, if one asks what it is, is nothing; where it is, nowhere*. It expresses itself in the flight of *Dasein* before itself as the flight into familiarity and tranquilizing. With these words — the "*nothing*" and "*nowhere*" of uncanniness, the same that *Sein und Zeit* §40 will give to the *Wovor* of anxiety — the lecture breaks off. *Unheimlichkeit* is not a psychological state (loneliness), not an object of reflection, not a property of a "personality"; asked *what* it is, it is *nothing*; asked *where*, *nowhere* — for it is not a being within the world but the *un-homeliness of being-in-the-world as such*, disclosed in the flight that *is everydayness*. The course that began with the *φαινόμενον* — what shows itself from itself — ends with the one phenomenon that "is nothing, nowhere," and yet is the most proper threat and disclosure of *Dasein*: the uncanniness before which the whole history of the care for certainty, from Aristotle's privileging of *θεωρία* through the scholastic *verum esse* to Descartes' *certum* and Husserl's absolute consciousness, has been a single, sustained flight. The "introduction to phenomenological research" is thereby complete as what it announced itself to be in the *Vorbemerkung*: not a doctrine, not a system, not even "philosophy," but the freeing of the gaze for *Dasein* — the being that we ourselves are, and from which we flee.
